# Selected Vital Statistics and Health Status Indicators

ONE HUNDRED AND THIRTY-SIXTH ANNUAL REPORT 2007

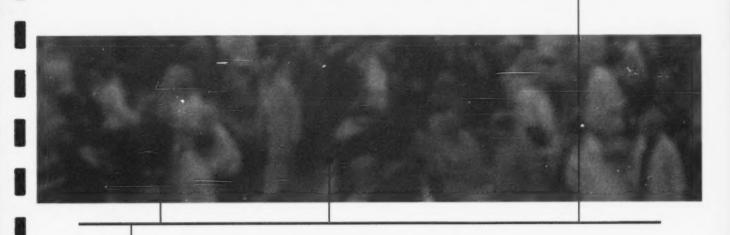

British Columbia Vital Statistics Agency

### Foreword

The British Columbia Vital Statistics Agency (the *Agency*) is pleased to present the 2007 Annual Report, the one hundred and thirty-sixth published since the establishment of the Division of Vital Statistics in 1872. The tables, figures, and maps in this publication are based on information collected from registrations of live births, stillbirths, deaths, and marriages, as registered by the Agency for events occurring in the 2007 calendar year.

This publication contains approximately 100 tables, figures, and maps that summarize selected information about the vital events taking place in British Columbia (BC). Although some tables and information relate to vital events occurring within the province which may include visitors to BC, such as marriages, the majority are specific to residents of BC.

The information relating only to residents is important for evaluating and monitoring the health status of the province's population.

Throughout the report, key indicators are presented for the province's Health Authorities (HA), Health Service Delivery Areas (HSDA) and Local Health Areas (LHA). The report includes a detailed Glossary, defining the terms used in the body of the publication; as well as a Methodology section, explaining the statistical computations in the main body. A set of Information Boxes supplement the standard tables with information on a wide range of subjects, from a profile of a Typical Day in British Columbia to Place of Birth for Midwife Assisted Births and Usual Residence of People Married in 2007.

Beginning with the 2000 Annual Report, the Agency has presented data using the tenth revision of the World Health Organization's International Statistical Classification of Diseases and Related Health Problems (ICD-10) coding scheme. Where possible, this report follows a format consistent with previous annual reports that presented statistics from the current year along with comparative statistics from the preceding five years. However, some tables and figures present statistics prior to 2000 when an earlier version of the coding scheme (ICD-9) was in effect. Many changes in the codes and in the rules for selection of the underlying cause of death preclude direct comparison of ICD-9 and ICD-10 data. Extensive manual reviews using translation tables in conjunction with recoding of data from ICD-9 to ICD-10 enabled the production of trend data. This approach is unique to publications of the Agency.

The Agency, would like to acknowledge the many groups and individuals who ensure complete and accurate recording of vital events. Their contributions have resulted in continual improvement in the quality of vital event data and the quality of this report.

Original signed by,

Jack Shewchuk Acting Chief Executive Officer British Columbia Vital Statistics Agency

## **General Information**

### Introduction

The Agency is responsible for the ascertainment, registration, and certification of vital events through the administration of the Vital Statistics Act, Marriage Act, and Name Act. Statistical information contained in this report is summary data provided by the Agency for use by government agencies, health planners, researchers, and the general public. In order to maintain confidentiality, the information does not disclose personally identifiable data.

### Registrations

Section 44 of the *Vital Statistics Act* states: "As soon as convenient after January 1 in each year, the chief executive officer must make, for the use of the Legislative Assembly and for public information, a statistical report of the births, stillbirths, marriages, deaths, adoptions and changes of name registered during the preceding calendar year."

The table below is presented to fulfill these requirements.

### VITAL EVENTS REGISTERED IN BRITISH COLUMBIA IN 2007

Event Type	Residents	Non-Residents		Total
Live Births	43,517	188		43,705
Deaths	31,105	271	1.	31,376
Stillbirths	350	2		352
Marriages <sup>1</sup>	20,465	2,496		22,961
Adoptions	600	102		702
Changes of Name <sup>2</sup>	4,654	STATE OF THE STATE		4,654

Note: 
¹Residents include marriages where only one party was a British Columbia resident, as well as those where both parties were residents.

<sup>2</sup>These registrations resulted in 5,066 name changes.

Although the *Vital Statistics Act* requires registration of events that occurred in the province, and Section 44 specifically requires that these be reported, vital events are often a reflection of the health status of the population, therefore most of the information in this report pertains to residents. Specifically, live birth, stillbirth, and death statistics summarize events that occurred in the province to BC residents only, and exclude events to non-residents except where noted. Marriage statistics summarize all events that occurred in the province to either residents or non-residents. Vital events that occurred to BC residents outside the province are not shown in this report; Statistics Canada makes adjustments for events that occur to Canadians outside their province of usual residence in its publications.

### VITAL EVENT DATA

Data presented in this report are based on registrations of birth, stillbirth, death, and marriage as reported to the Agency. Registration requirements for each type of event are outlined briefly as follows:

**Live Births**: The *Vital Statistics Act* prescribes the legal requirements for the registration of live births. The parent(s) of the child have the responsibility to complete the Registration of Live Birth within 30 days of the event. The physician or registered midwife who was in attendance at the birth must complete a *Notice of Live Birth or Stillbirth* (NOB) form which must be made available to *the Agency* within 48 hours of the event. Other requirements must be met if the birth was not attended by a physician or registered midwife.

Stillbirths: In the event of a stillbirth, the parent(s) must complete the Registration of Stillbirth. The physician or registered midwife who was in attendance at the birth must complete a *Notice of Live Birth or Stillbirth* (NOB) form. In addition, a physician or coroner is required to complete the Medical Certification of Stillbirth portion of the Registration of Stillbirth and deliver it to the funeral director who in turn submits it to *the Agency*.

**Deaths**: The physician in attendance at the last illness of the deceased person, or the coroner conducting an inquiry into the death of the person is required to complete a *Medical Certification of Death*. The *Registration of Death* is completed by the informant with assistance from the funeral home. The funeral home director submits both documents to *the Agency* to complete the registration and proceeds to issue the burial permit.

Marriages: The Marriage Act prescribes the legal qualifications of individuals to marry, the authorization of Religious Representatives and Marriage Commissioners to perform the marriage ceremony, and the solemnization of marriage. Under the Marriage Act, the Agency licences Religious Representatives of established religious denominations who desire the authority to solemnize marriage. The Agency recommends for appointment Marriage Licence Issuers and Marriage Commissioners to perform civil ceremonies.

Couples who meet the legal qualifications to marry must obtain a marriage licence up to 90 days before the ceremony. They can choose a civil ceremony performed by a *Marriage Commissioner* or a religious ceremony performed by a *Religious Representative*. The *Registration of Marriage* is completed by the officiant after the ceremony, and must be signed by the officiant, the parties getting married, and two witnesses.

### MEDICAL CODING

The Notice of Live Birth or Stillbirth (NOB) includes information on birth weight, gestation, and mode of delivery, as well as abnormalities of the infant and complications of pregnancy, labour, and delivery. The Medical Certification of Death and the Medical Certification of Stillbirth include information on the immediate cause of death or stillbirth, antecedent causes giving rise to the immediate cause, and other significant conditions contributing to the death or stillbirth. This information is processed by medically trained staff using the World Health Organization's International Statistical Classification of Diseases (ICD) coding scheme. For deaths, the coding system is applied via a coding software developed in the United States and distributed for use across Canada by Statistics Canada. In some instances the Agency's medical coding staff has determined that strict adherence to the automated ICD classification process would misstate the intention of the physician completing the Medical Certification of Death. In these cases the Agency deviates slightly from standard ICD coding software output for the material presented in this report. Data coded to automated ICD classification standards are maintained by the Agency for comparison to other jurisdictions and for submission to Statistics Canada. The data presented in this report do not necessarily correspond to data for BC published elsewhere.

Since the early 1900s, the *International Statistical Classification of Diseases* (ICD) has been revised regularly in order to reflect advances in medical science and changes in diagnostic terminology. The ninth revision of ICD (ICD-9) was used for medical coding of birth complications and causes of death from 1979 until 1999. Coding according to the tenth revision (ICD-10) was implemented at the beginning of the year 2000. Many changes in the codes and in the rules for selection of the underlying cause of death precluded direct comparison of data in ICD-10 with data from earlier years. Translation tables were used, and extensive manual reviews and recoding of data from ICD-9 to ICD-10 were completed in order to be able to provide trend data in this annual report.

### TIME PERIODS

This report pertains to events that occurred in the calendar year 2007. Selected tables present aggregate information for the previous five-year period. These broader time periods permit more meaningful tests of statistical significance when analyzing data at sub-provincial levels, and can smooth out random fluctuations that occur when annual numbers are small. For regional health status profiles, readers are encouraged to refer to measures of statistical significance and use data presented for the five-year aggregates.

The data for earlier years have been updated and may differ from other publications. Readers should treat this report as a replacement of previous publications and avoid comparisons with tables in earlier publications.

### POPULATION DATA

Mid-year population estimates for incorporated communities, local health areas, and health regions were provided by BC STATS, Ministry of Labour and Citizens' Services. In the mortality section of this report, a 'standard population' is used in the calculation of Age Standardized Mortality Rates (ASMR) and Potential Years of Life Lost Standardized Rates (PYLLSR). *The Agency* has used the 1991 Canadian Census population as the 'standard population' in the calculation of these age-standardized measures since 1998. Please refer to *Standard Population* in the *Glossary* for a more detailed description and the *Methodology* section for examples of computations of measures and statistical tests.

### SPATIAL ANALYSIS AND MAPPING

This report presents regional analyses using data dissemination areas used by the Ministry of Health Services (Health Authority, Health Service Delivery Area, and Local Health Area) and for incorporated communities (see Figures 1 and 2). This continues the practice established in 2001 and provides Health Authorities a consistent time series of health status indicators for their regions. Health care services are managed and delivered by five Health Authorities (HAs) that govern, plan, and coordinate services regionally within 16 Health Service Delivery Areas (HSDAs). The Interior Health Authority encompasses four HSDAs. Fraser, Vancouver Coastal, Vancouver Island, and Northern Health Authorities, each consists of three HSDAs. HSDAs can be further divided in Local Health Areas (LHAs). Vital events are allocated to these data dissemination areas by the postal codes recorded on registration documents.

Marriages are assigned geographically by the postal code of the location where the marriage ceremony was performed; other vital events are assigned by the usual residence of the parents (for live births and stillbirths) or the decedent (for deaths).

Converting statistical data to maps can often reveal relationships that are not readily discernable in tabular form. The maps in this report present local health area data ranked by quintiles and allow easy visual examination of spatial patterns. Although statistics for all LHAs are presented in the maps, emphasis should be placed on those that are statistically significant. Maps have been included in the Vital Statistics Annual Reports since 1989 in order to disseminate relevant community level health information to the public and to local health service providers, planners, and educators. These allow communities to address their own specific health challenges and identify local health priorities. This can foster locally based solutions and more appropriate decision making.

### TERMS, METHODS, AND COMPUTATIONAL EXAMPLES

Readers are encouraged to refer to the *Glossary* for explanations of terms. The *Methodology* section provides examples of computations of measures and statistical tests.

### Vital Statistics Information Box

### ON A TYPICAL DAY IN BRITISH COLUMBIA IN 2007

#### 119 LIVE BIRTHS OCCURRED IN THE PROVINCE TO BC RESIDENTS:

- 61 males and 58 females were born
- 4 were born to teenage mothers
- 27 were boin to mothers aged 35 years old or more
- 4 were multiple births
- 37 were cesarean deliveries
- 7 were low birth weight babies
- 9 were pre-term
- 62 live births involved maternal complications
- 40 babies had perinatal complications
- 10 stillbirths every 10 days

#### 85 DEATHS OCCURRED IN THE PROVINCE TO BC RESIDENTS:

- 44 males and 41 females died
- 67 deaths were seniors aged 65 years old or more including
  - 43 deaths aged 80 years old or more
- 7 deaths every 10 days were children less than 15 years old including
  - 5 infant deaths every 10 days
- 26 deaths were due to diseases of the circulatory system including
  - 18 from cardiovascular disease
  - 6 from cerebrovascular disease
- 24 deaths were due to malignant neoplasms (cancer) including
  - 6 from malignant neoplasm of trachea and lung
  - 3 from malignant neoplasm of colon and rectum
  - 2 from malignant neoplasm of female breast
  - 9 deaths were due to diseases of the respiratory system including
    - 3 from pneumonia and influenza
    - 4 from chronic pulmonary disease
  - 3 deaths every 10 days were due to HIV disease
  - 4 deaths were from external causes including
    - 1 suicide
    - 1 motor vehicle accident
    - 1 unintentional fall
- 5 deaths were alcohol-related:
  - 1 directly due to alcohol and 4 indirectly due to alcohol
- 1 death was drug-induced
- 17 deaths were attributed to smoking

#### 63 MARRIAGES WERE SOLEMNIZED IN THE PROVINCE:

- 39 were civil ceremonies and 24 were performed by religious representatives
- 41 marriages were to couples where both parties were marrying for the first time
- 2 marriages every 10 days were to couples where both parties were teenagers

### Trends Introduction

The tables and figures in this part of the Annual Report provide a long term historical review of birth, death, and marriage statistics during the past few decades. They provide a broad context for the recent vital event statistics shown in other parts of this report. Long term trends are always useful for evaluating recent events and trends, so the tables and figures are often cross referenced to related tables in subsequent parts of the report.

#### Overview

This section begins with a review of population, live birth, stillbirth, death and marriage trends. This is followed by information on natural population increases and vital events by month.

Table 1 summarizes vital events that occurred from 1950-2007 and includes the mid-year BC populations. The BC population has shown a steady increase since 1950 so the columns indicating the rates are the most telling of indicators.

The rate of live births to residents increased steadily from 1950 to 1957 (as shown in Table 1). It levelled until 1960, and then dropped quite rapidly during the next ten years after which the decline moderated but generally continued until 2005. In 2006 and 2007, there was a slight increase in the rate of live births over the previous years. This has not occurred since 1988. The death rate, on the other hand, has declined from about ten per 1,000 population in 1950 to about seven per 1,000 in the mid 1980s and remained at about that level until 2007.

Marriage information pertains to all marriages solemnized in the province, not only those to residents. The marriage rate was about 10 marriages per 1,000 British Columbians in 1950 but declined to about seven per 1,000 in 1960, then rose again to almost the 1950 rate by 1970. Since then, the marriage rate has declined to about 5 marriages per 1,000 population in 2007.

Regarding stillbirths, readers should be aware that there was a change in definition which led to the apparent 'jump' in numbers and rates in 1963. That change, and another in 1986, is explained under Stillbirth in the *Glossary*. Other than the increase in 1963 and irregularities due to small numbers of stillbirths, rates generally declined until the early 1990s and have fluctuated around seven per 1,000 total births since then.

Table 2 and Figure 4 show the rate of natural population increase (NPI) in BC and Canada since 1950. Natural population growth is explained in the *Glossary*. Not counting migration into or out of BC, the population grew "naturally" by 12,412 or at the rate of 2.8 per 1,000 British Columbians in 2007.

BC's rate of NPI has been consistently below Canada's except for the first half of the 1980s. Both BC's and Canada's rates have gradually declined since the late 1950s.

Table 3 and Figure 5 show the number of live births, deaths, marriages, and stillbirths to residents according to the month in which they occurred. The number of marriages each month includes residents and non-residents. The percent columns show the monthly percent of all events to residents, except marriages which show the percent of all marriages. The table also includes the number of live births, deaths and stillbirths to non-residents.

There is continual speculation and anecdotal evidence that vital events tend to occur in particular months or seasons. The data presented in Table 3 and Figure 5 may not put an end to that speculation, but live births and deaths were pretty evenly distributed across the months and seasons in 2007. On the other hand, there was a clear preference to marry during the summer months. Although there were fluctuations in the number and percentage of stillbirths, due to the small number of events, no trend was apparent.

TABLE 1 LIVE BIRTHS, DEATHS, MARRIAGES AND STILLBIRTHS
BRITISH COLUMBIA, 1950-2007

	Mid-year		Births	Dea		Marri			births
Year	Population	Number	Rate	Number	Rate	Number	Rate	Number	
1950	1,137,000	27,116	23.85	11,581	10.19	11,110	9.77	369	13.43

006	4,320,255	41,673	9.65	30,536	7.07	23,517	5.44	335	7.97

Note: Rates shown for live births, deaths and marriages are crude rates per 1,000 population. Stillbirth rate is per 1,000 total births (live births plus stillbirths). The definition of a stillbirth was revised in 1963 and 1986 (see Glossary). Population information from BC Stats, Ministry of Labour and Citizens' Services. Above information include late registrations and amendments. Gender unknown included. Non-residents are excluded from all data except marriages.

### Fertility and Live Birth Trends

The Total Fertility Rate (TFR) in Table 4 is the number of births 1,000 women can expect during their child bearing years, that is, from 15 to 44 years of age. It is described more fully in the *Glossary* and an example of the calculation method is shown in the *Methodology* section.

The fertility rate in BC today is about half the 1950s rate. Shortly after World War II, fertility began to increase, commonly referred to as the post war baby boom. As shown in Table 4, fertility rates increased from 1950 to 1960 after which there was a sharp decline until the late 1970s. Since then the declining trend has continued more slowly, with some fluctuations, until 2007. Figure 6 shows that slow decline over the last two decades. Fertility by Local Health Areas and among teenagers is analysed in Table 10 and Figure 29 respectively.

In addition to trends in Total Fertility Rates, this section discusses trends in maternal age, multiple births, low birth weight, and cesarean section deliveries.

Figure 7 shows annual percentages of live births to women in three age groups for the years 1986-2007. The oldest group (aged 35 years or more) is gradually increasing its percentage compared to the two younger groups (less than 20 years and 20 to 34 years old). The average age at which women are bearing children is increasing, but still about three quarters of live births are to women in the 20-34 years age group. Maternal age is related to other important birth characteristics and is a component of several tables in the birth related statistics section of this report.

As illustrated by Figure 8, the percentage of births that are multiple births has increased substantially between 1986 and 2007. Multiple birth infants have a higher risk of being preterm, having low birth weight, suffering perinatal death or illness than singletons<sup>1</sup>. Multiple birth infants accounted for 1.9 percent of all live births in 1986 and 3.1 percent in 2007. This was a statistically significant increase at the 95 percent level.

Figures 9 and 10 both illustrate the occurrence of Low Birth Weight (LBW) live births (those births with a birth weight of less than 2,500 grams) over the period 1986-2007. Figure 9 shows both the counts of such births and the rates per 1,000 live births for all mothers. Figure 10 shows the rate per 1,000 live births for mothers 35 years and older. While LBW rates increased gradually from 46.9 in 1986 to 57.3 per 1,000 live births in 2007. The rate in older mothers has increased more sharply from 45.2 in 1986 to 70.2 per 1,000 live births in 2007. The trend in each of these graphs is statistically significant at the 95 percent level.

Three relevant indicators are presented in Figures 11, 12, and 13. The upward trend in the cesarean section rates since 1986 (Figure 11) is statistically significant at the 95 percent level, and the increase appears greater in the last few years. Cesarean sections by Health Service Delivery Area (HSDA) varied considerably in 2007 (Figure 12) from a low of 24.8 percent of live births to residents of Kootenay Boundary to a high of 36.3 percent of live births to South Vancouver Island residents.

An important consideration regarding cesarean sections is the age of the mother. There were clear differences between age groups (Figure 13), with cesarean rates highest for mothers aged 35 or older and lowest for teen mothers. However, all age groups showed upward trends that were statistically significant at the 95 percent level.

Cesarean deliveries are shown in relation to other modes of delivery in Table 11 and by Local Health Area (LHA) in Table 12 and Figure 30.

### Infant Mortality Trends

Table 5 shows the number of infants in BC who died before their first birthday in the years 1965-2007. Also shown are the rates at which these deaths occurred per 1,000 live births and similar rates for Canada. The infant death rate in Canada and BC decreased to around one fifth of the 1965 level by 2007. When these deaths are broken into three ranges according to the infant's age when the death occurred, it is clear that well over half of all infant deaths occur in the first six days of life. The *Glossary* defines the various divisions of infant deaths according to the infant's age.

For most of time period covered by Table 5, there are comparable data at the Canadian level. Until 1991, Canada's and BC's infant mortality rates were similar. Since then BC's rate of infant mortality has been lower than the overall Canadian rate.

Figure 14 clearly illustrates the downward trends in both the number and the rate of infant deaths over the past 20 years. Both trends are statistically significant at the 95 percent level.

Figure 15 and 16 show that historically infant mortality rates have been relatively high among teenage mothers, although only a small proportion (9.9 percent) of total infant deaths in 2007 were babies born to these young women. A downward trend in infant mortality rates in all age groups is seen in Figure 15. Each of these trends is statistically significant at the 95 percent level.

More information about infant mortality can be seen in the infant mortality section of death related statistics in this report.

#### Death Trends

This section begins with an examination of counts and rates for all causes of death since 1986. This is followed by information on the average age at death, and cause of death trends for malignant neoplasms (cancer), endocrine, nutritional and metabolic diseases, nervous system diseases, cardiovascular diseases, cerebrovascular diseases, and motor vehicle accidents.

Note that all causes are based on the Underlying Cause of Death (UCOD), which is explained in the *Glossary*. While other causes may have contributed to the death, the underlying cause is defined as the condition or injury that initiated the train of events leading directly to death.

While Figure 17 shows an increase in the absolute number of deaths from 1986 to 2007, the standardized rate has been steadily declining. The provincial Age-Standardized Mortality Rate (ASMR) has been on a downward trend since 1986. The trend is not only statistically significant at the 95 percent level, but reached a historic low in 2007.

The rates are quoted per 10,000 population and have been age-standardized to the 1991 Canada census population distribution. See the *Glossary* for an explanation of ASMR and the *Methodology* section for an example of the calculation method.

Figure 18 shows that the average age at death among British Columbians has reached an all time high in 2007 at 74.0 years. The trend indicates an increase over the 1986 to 2007 time period, and this trend is statistically significant at the 95 percent level. It should be noted that average age at death is the arithmetic average of the ages at which people died and is not equivalent to Life Expectancy which is explained in the *Glossary*.

Figures 19 through 27 refer to selected major causes of death categories. Figures 19, 20, and 21 illustrate trends in cancer death and rates. The death rates are expressed as ASMRs.

Figure 19 shows that in the years 1986 to 2007, while the number of deaths due to all types of cancer (malignant neoplasms, ICD-10 codes C00-C97) steadily climbed, the ASMR has fallen. Thus, while cancer death incidence climbed, the size of the British Columbian population climbed at an even faster pace.

Figure 20 is a similar graph showing incidence and death rates due to lung cancer (malignant neoplasms of trachea and lung, ICD-10 codes C33-C34). While the numbers of lung cancer deaths in BC have increased since 1986, the size of the British Columbian population has climbed at an even faster rate, resulting in falling rates of lung cancer deaths.

Figure 21 provides further detail by gender for the lung cancer information shown in Figure 20. The falling trend in lung cancer deaths overall is being driven by the strong decline in lung cancer deaths among men, as there is a gradually increasing trend in the rate of lung cancer deaths among women. The declining trend in lung cancer deaths among men and the increasing trend in lung cancer deaths in women are both statistically significant at the 95 percent level. Deaths due to cancer are shown in the context of other causes of death in tables 21, 22, and 23 in the death-related statistics section of this report.

Deaths due to endocrine, nutritional and metabolic diseases in Figure 22 (ICD-10 codes E00-E89) include diseases such as diabetes and cystic fibrosis. A comprehensive list of diseases in this category is provided in *Appendix 2 - Detailed Cause of Death by Age and Gender*. The death rates and counts for these conditions increased during the period from 2000 to 2005 with a slight decline in 2006 and 2007.

Diabetes mellitus mortality in 2007, as shown in Figure 23, is about three times that of 1986.

Deaths due to diseases of the nervous system are shown in Figure 24 and include causes such as Alzheimer's disease, Parkinson's disease, and multiple sclerosis – a comprehensive list of diseases in this category appears in Appendix 2 under ICD-10 codes G00-G99. The number and rate of these deaths increased between 1986 and 2001. From 2001 to 2005 the number levelled off and the rate declined followed by a slight increase for both the number and rate in 2006 and 2007. The increasing trend from 1986 to 2007 was statistically significant at the 95 percent level.

Figure 25 shows numbers of cardiovascular disease deaths (ICD-10 codes I00-I51) and death rates per 10,000 standard population from 1986 to 2007. While the incidence numbers rose from 1986 to 1996 and then generally declined, the death rate has been consistently falling since 1986. This declining trend is statistically significant at the 95 percent level. See Tables 22 and 23 to compare cardiovascular disease deaths in the context of other causes of death.

Cerebrovascular diseases shown in Figure 26 include ICD-10 codes I60-I69. While the number of people dying from these diseases increased, the standardized rate gradually decreased between 1986 and 2007. This decreasing ASMR trend is statistically significant at the 95 percent level.

In Figure 27 the incidence and death rates for motor vehicle accidents over the period 1986 to 2007 declined. The downward ASMR trend is statistically significant at the 95 percent level. Although motor vehicle deaths have, on average since 2000, accounted for about 1.4 percent of all deaths, a substantial share of deaths due to motor vehicle accidents are among young British Columbians and as such they remain a concern. See Tables 34 and 35.

#### **Marriage Trends**

Table 6 and Figure 28 display the average age at which men and women get married. Over the last couple of decades the average age for first marriages increased by 5.8 years for men, and by 6.5 years for women.

The average age for all marriages increased from 29.3 years to 35.5 years for men and for women rose from 26.2 years to 33.0 years over the last 21 years.

Over that same time period the average age of men marrying tended to be 2 to 3 years older than the average age of women marrying. Generally, the age difference at which men and women marry was greater for all marriages than for first marriages.

# **Birth-related Statistics**

### Birth Introduction

Statistics based on birth events form a crucial part of the demographic profile of communities, regions, provinces, and countries. They are used to derive important indicators of health status, fertility, infant mortality, and population growth. In turn, those indicators are used for health planning, policy formulation, research, and commerce. The tables in this part of the report present birth statistics categorized by maternal characteristics and other related measures. The tables refer only to live births except Table 7 which also includes stillbirths. The mother's usual residence is used to identify geographic location.

#### Births - General Indicators

Certain birth and parental characteristics that are presented in this section have been shown to be related to the infant's health status or are of general interest. These characteristics include age of mother, age of father, kind of birth (single, twin, or multiple), LHA of usual residence, and mode of delivery.

Table 7 shows the live birth cardinality by mother's age. Over 80 percent of live births in 2007 were first or second births. Second, third, and subsequent live births tend to have been delivered to progressively older women.

Table 8 shows the number of live births in BC in 2007 by the age of mother and the age of father. It also shows, for each maternal age range, the number of infants born to couples who were not formally married to each other (Out-of-Wedlock).

Over half of the births (50.1 percent) in 2007 were to mothers 30 to 39 years old and 42.6 percent were to mothers in their twenties. Only 3.4 percent were to mothers less than 20 years and 4.0 percent to those 40 or older. For fathers, over half (52.6 percent) were in their thirties, more than a quarter (27.5 percent) were in their twenties, 13.7 percent were in their forties or older and 1.0 percent were less than 20 years old. In 5.3 percent of births, the father's age was not indicated.

Less than one percent (0.8 percent) of births (327) were to couples who were both in their teens; births to couples in which at least one person was a teen, made up 3.6 percent (1,558) of births.

While there were only 103 births (0.2 percent) to mothers age 45 years old and over, 3.9 percent (1,704) of all newborns had fathers in that age group.

Table 9 shows the number of births where a single baby was delivered, the number of births that were twin deliveries, and the number that were triplets or more, according to the mother's age group. In 2007, 5.0 percent of births to mothers 35 years and older were multiple live births; whereas, 2.7 percent of live births to mothers aged 20 to 34 were multiples and teenagers had the lowest proportion (1.4 percent).

In recent decades there has been a gradual increase in multiple birth rates in BC (see Figure 8). The proportions of multiple live births increased from 1.9 percent of all live births in 1986 to 3.2 percent in 2007, but most births (96.8 percent) are still singletons.

Table 10 shows the 2007 fertility rates in the LHA where the mother resided and by maternal age groups. The table also shows the number of live births to women 15-19 years of age over the 5 year period 2002-2006 and the fertility rate for that age group.

In Figure 29 the *Age Specific Fertility Rate* (ASFR) statistics for 15-19 year olds for the 5 year period 2002-2006 are shown by LHA. The ASFR is described more fully in the *Glossary* and an example of the calculation method is shown in the *Methodology* section.

Table 11 shows the number and percentage of births in each maternal age group according to their mode of delivery. Generally, the proportion of births that were spontaneous vertex deliveries (which generally require no medical intervention), and to a lesser extent births assisted by vacuum extraction, are higher for younger mothers. On the other hand, deliveries by cesarean section are proportionally higher for older mothers (see also Figure 13).

Cesarean section deliveries in BC increased from 209.6 per 1,000 live births in 1986 to 310.6 in 2007 (see Figure 11).

Table 12 shows live births by the Local Health Area where the mother usually resided and focuses on spontaneous vertex and cesarean section modes of delivery. Spontaneous breech, forceps, and vacuum deliveries are combined into the 'Other' category. The table shows the number and percent of live births that were delivered by cesarean section.

The columns on the right side of the table indicate the total number of live births in 2007 to residents of each LHA and the birth rate per 1,000 population. The LHA with the highest live birth rate was more than four times the rate of the lowest. For more comparisons of cesarean rates see also Figures 11, 12, and 13.

In Figure 30 the Local Health Areas (LHAs) are grouped by their ratio of observed number of cesarean live births over expected number of cesarean live births for 2007. The figure shows the LHAs in quintiles from those with the highest cesarean ratios (quintile 5) to those with the lowest such rates (quintile 1).

FIGURE 29

Inset 2

#### Notes for Table 10

ASFR: Live births per 1,000 women in each specific age group of childbearing age.

TFR: Sum of age-specific (15 to 44 years) fertility rates multiplied by the number of years in each age group (see Glossary for definition).

"Statistical testing indicates that fertility rate is significantly different from the average rate (p<0.05, two tailed).

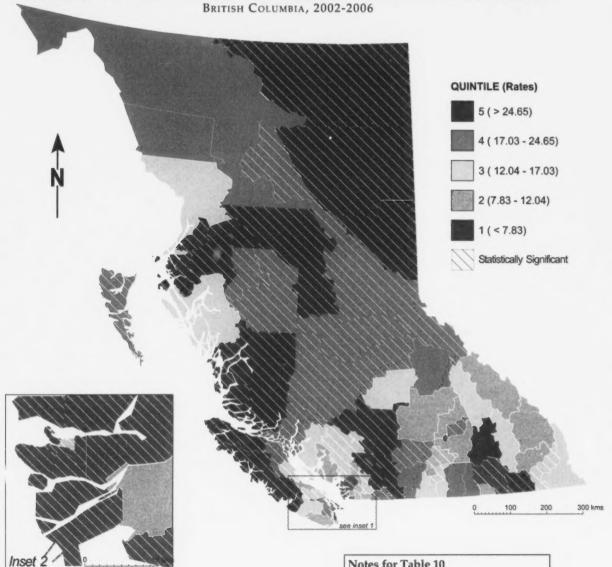

Non-residents are excluded.

Note: ASFR - Live births per 1,000 women age 15 to 19 years. Refer to Figure 1 to clarify geographical location of LHAs.

#### Notes for Table 10

ASFR: Live births per 1,000 women in each specific age group of childbearing age.
TFR: Sum of age-specific (15 to 44 years) fertility rates

rrs. sum or age-specinc (13 to 44 years) remitify rate multiplied by the number of years in each age group (see Glossary for definition).

"Statistical testing indicates that fertility rate is significantly different from the average rate

(p<0.05, two tailed). Non-residents are excluded.

Note: ASFR - Live births per 1,000 women age 15 to 19 years. Refer to Figure 1 to clarify geographical location of LHAs.

#### Vital Statistics Information Box

#### PLACE OF BIRTH FOR MIDWIFE ASSISTED BIRTHS

BRITISH COLUMBIA, 2000-2007

The College of Midwives of British Columbia was established in 1995 and the first midwives were registered to practice in 1998. The Vital Statistics Agency implemented procedures to identify births delivered by registered midwives in 1998, and, by 1999, could identify all midwife assisted births. The table below shows the place of birth for midwife assisted births in the province from 2000 to 2007.

		2000	2	001	200	12	20	03	2	004	2	005	1 2	2006	1	2007

# Inset 1 0 50 kms

#### Notes for Table 12

Note: Ratio – observed over the expected cesareans in the specified area. Percent based upon live births in the specified area. Rate per 1,000 population in the specified area. "Statistical testing indicates that observed cesarean births are significantly different from the expected (p<0.05, two tailed). +Denotes significance based on less than five births. Other is comprised of spontaneous breech, forceps, and vacuum. Total includes residents with unknown LHA. N.S. - Not Stated.

Note: Ratio - Observed over the expected. Refer to Figure 1 to clarify geographical location of LHAs.

FIGURE 30

# CESAREAN DELIVERIES OF LIVE BORN INFANTS BY LOCAL HEALTH AREA

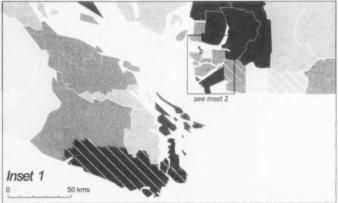

#### Notes for Table 12

Note: Ratio – observed over the expected cesareans in the specified area. Percent based upon live births in the specified area. Rate per 1/000 population in the specified area. 'Statistical testing indicates that observed cesarean births are significantly different from the expected (p<0.05, two tailed). +Denotes significance based on less than five births. Other is comprised of spontaneous breech, forceps, and vacuum. Total includes residents with unknown LHA. N.S. - Not Stated.

Note: Ratio - Observed over the expected. Refer to Figure 1 to clarify geographical location of LHAs.

#### Births - Birth Weight

Birth weight is recognized as a primary indicator of newborn health not only in BC and Canada but worldwide. It is also an important predictor of subsequent health and well being, as well as disability and death, among newborn infants. In BC a baby is weighed (in grams) immediately after birth, and that weight is used as one of the diagnostic indicators of fetal growth.

The following tables show birth weight categorized by other indicators related to birth weight, such as gender, gestational age, and maternal age.

Babies born at term (37 to 41 weeks) and between 2,500 and 4,499 grams have been shown to have the most favourable prospects for good health and Table 13 indicates that 38,471 births or 88.4 percent of all live births in 2007 were in that category. There were 3,272 pre-term births (less than 37 weeks) which accounted for 7.52 percent of all live births.

Table 14 shows the number of live births to residents of BC in 2007 according to maternal age group and infant birth weight category. By far, most of the babies in each age group had healthy weights (from 2,500 to 4,499 grams).

Table 14 shows that mothers in the mid-age categories had the largest proportions of healthy weight babies and the lowest proportions of LBW babies (weighing less than 2,500 grams).

Table 15 displays the number and percent of LBW babies by gender according to the mother's age group. Female babies have a higher rate of LBW (60.37 per 1,000 female live births) than males (54.40 per 1,000 male live births).

Figure 31 graphically shows the pattern of LBW by maternal age groups. Women in the middle age groups had the lowest rates of LBW babies in 2007 with increasing rates in subsequent age groups. Older mothers not only have increased rates of LBW babies but the rate among older mothers has shown an increasing trend since 1986 as indicated in Figure 10.

Table 16 shows the incidence of LBW babies in the period 2002 to 2006 and the year 2007, stratified by the LHA of maternal residence for the whole province. As well as the incidence of such births, the 2002 to 2006 portion of the table shows the LBW rate per 1,000 live births and the ratio of the observed and expected number of LBW births in the LHA.

There were 17 LHAs with ratios that were statistically significant. Of these only 7 were high. The 2007 data show the incidence figures broken down by three categories of gestational age of the newborn, the total number of LBW births, and the rate. In some LHAs the number of LBW babies was quite low in 2007 so the rates should be viewed with caution.

Figure 32 shows BC LHAs displayed in five levels according to the 2002-2006 observed versus expected LBW ratio. High ratios, (Quintile 5, deep red colour) mean that an LHA had quite a high ratio in the years 2002-2006. At the other extreme, the areas shown as dark grey have a relatively low ratio.

#### Births - Maternal Complications and Perinatal Conditions

Both maternal complications and perinatal complications can be used as health status indicators. Only diagnoses affecting pregnancy, labour, or delivery were selected for the maternal complications part of this report. Perinatal complications consist of diagnoses affecting the baby shortly before, during, or after birth.

The maternal complications shown in Table 17 are limited to those diagnoses that affected pregnancy, labour, or delivery. Note that an unlimited number of complications can be noted for each birth, so the total number of maternal complications can be greater than the number of live births with maternal complications.

Assisted or Surgical Delivery and Maternal Abnormalities of the Pelvic Organs were the two most frequent diagnostic categories of maternal complications in 2007 and the previous five years. The proportions of age group births that had pelvic organ abnormalities (including conditions such as cervical incompetence as well as scarring from surgeries such as previous cesarean sections) were observed more frequently in older mothers. Births complicated by Maternal Abnormality of Pelvic Organs made up 0.6 percent of births to mothers aged under 20 years compared to 6.8 percent of births for mothers 40 years and over. The proportions of age group births that had at least one complication are shown along the bottom of the table.

Elderly primigravida (ICD-10 code Z35.5) refers to women aged 35 or older who are experiencing their first pregnancy. This condition has always been recorded; however, the ICD-9 code (659.5) was included with other complications of labour and delivery, while ICD-10 puts elderly primigravida in the chapter with factors influencing health status and contact with health services. Elderly primigravida comprised 5.2 percent of all maternal complications in 2002-2006 and 5.5 percent in 2007 as shown in Table 17.

Table 18 shows the incidence of live births with maternal complications by LHA for the period 2002-2006 and for the year 2007. The observed births columns show the number of live births with complications stratified by maternal LHA of residence. The ratios indicate the number of observed births divided by the number that would be expected if the LHA had the provincial rates and (p) indicates those LHAs where the observed number was significantly different from the expected.

In 2007 there were statistically significant low ratios in 12 LHAs; 7 LHAs had high ratios that were statistically significant. In the 2002 to 2006 period, 24 LHAs had low ratios that were statistically significant and 14 LHAs had high ratios that were statistically significant.

The map in Figure 33 shows the LHAs identified in their quintile ranks by their 2002-2006 ratios of observed births with maternal complications versus the expected number of births with such conditions. LHAs with the highest ratios are coloured deep red; those with the lowest ratios are dark grey.

The conditions listed in Table 19 consist of diagnoses affecting the baby shortly before, during, or after birth. The table shows the number and percent of all perinatal conditions in each condition category for 2002-2006 and 2007. The 2007 portion of the table also shows the conditions by maternal age group. Again, an unlimited number of complications can be noted for each birth, so the total number of perinatal conditions at the bottom of the table may exceed the number of live births with at least one perinatal condition.

Intrauterine hypoxia and birth asphyxia accounted for most of the perinatal conditions in both time periods (45.2 percent in 2002-2006 and 41.6 percent in 2007). Conditions related to short gestation and those related to long gestation or high birth weight together accounted for 39.6 percent of the conditions in 2007 and 32.0 percent in the 2002-2006 period.

Table 20 shows the incidence of live births with perinatal conditions, by the mother's LHA of residence for the period 2002-2006 and for the year 2007. In 2007, there were 30 LHAs where the observed number of perinatal complications was significantly different from the expected number, and in 21 of these, the observed number was significantly higher.

Figure 34 map shows the LHAs identified in their quintile ranks by their 2002-2006 ratios of observed births with perinatal complications to the expected number of births with such conditions. LHAs with the highest ratios are coloured deep red; those with the lowest ratios are dark grey.

Live births with the above	- Number	105,373		608	8,925	11,997	1,140		22,672	
maternal complications	- Percent(*)			41.5	48.2	55.1	65.5		52.1	

Note: Percent based upon maternal complications. Percent (\*) based upon live births for the specified maternal age group. 

Where no other complication code is found. Total percentage may not add up to 100 due to rounding. 
N.S. - Not Stated. Non-residents are excluded.

#### Vital Statistics Information Box

#### TOP 25 BABY NAMES IN 2007

Each year the British Columbia Vital Statistics Agency produces a list of the most chosen baby names. The table below provides the top 25 names. Alternate spellings of names that sound alike (such as Catherine, Katherine, and Katharine) are not combined. The complete 2007 list, as well as lists for several previous years can be found at <a href="http://www.vs.gov.bc.ca/babynames/index.html">http://www.vs.gov.bc.ca/babynames/index.html</a>. In 2007, 628 boys' names and 706 girls' names were chosen for ve or more newborns.

Rank	Name	Number	Name	Numbe
1	Ethan	291	Ava	236

2007

Note: "Statistical testing indicates that the observed number of births with maternal complications is signficantly different from the expected (p<0.05, two tailed). Ratio - observed over expected. Percent of observed births is based on total live births. Total includes residents with unknown LHA. Non-residents are excluded.

2002-2006

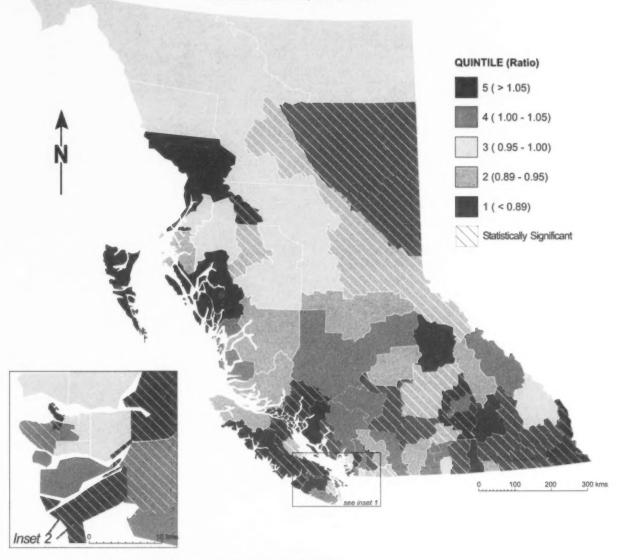

2007

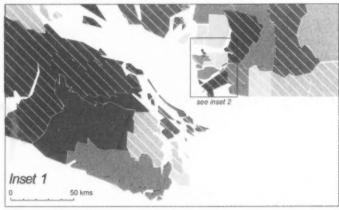

Note: "Statistical testing indicates that the observed number of births with maternal complications is significantly different from the expected (p<0.05, two tailed). Ratio - observed over expected. Percent of observed births is based on total live births. Total includes residents with unknown LHA. Non-residents are excluded.

#### Vital Statistics Information Box

#### BIRTH AND OLDER MOTHERS IN BRITISH COLUMBIA 1996 - 2007

Older mothers, those aged 35 and over have increased their share of the total births to women in BC. Since 1996, the share of singleton births attributable to older mothers has increased by nearly 50 percent and the share of multiple births attributable to older mothers has nearly doubled. More of these births are via cesarean section, however, the proportion of these births considered to be Low Birth Weight has remained relatively stable.

# PROPORTION OF SINGLETON AND MULTIPLE BIRTHS TO MOTHERS AGED 35 AND OLDER

Note: Births consist of live births only. Non-residents are excluded.

#### Death Introduction

In recognition of the importance of mortality statistics for health surveillance, planning and research a comprehensive array of tables is presented in this part of the report. Causes of death and/or age at death form the base of most tables because they are crucial components of health status for regional, national, and international comparisons. While other causes may have contributed to the death, the *Underlying Cause of Death* (UCOD) (see *Glossary*) is defined as the condition or injury that initiated the train of events leading directly to death, and was used for these tabulations. All causes are identified according to the World Health Organization's *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision* (ICD-10) which is a statistical coding system and the accepted international standard for mortality coding. The groups of codes used to define particular topics are noted in the tables.

#### Deaths - General Indicators

An overall view of the number of deaths by ICD-10 chapters by age group and gender is shown in Table 21. It provides a summary of the contribution of the 19 diagnostic categories to total deaths in BC in 2007. More detailed information for the same age groups appears in Appendix 2, which provides counts at the "3 character level". Although the causes shown in Appendix 2 ("Detailed Cause of Death by Gender and Age") are fairly specific, most ICD-10 codes consist of four or five characters, and are therefore even more detailed than the "roll ups" shown in Appendix 2. Neoplasms and diseases of the circulatory system accounted for most of the deaths in 2007 for both genders. Deaths in those two cause categories are further analysed in the following sections.

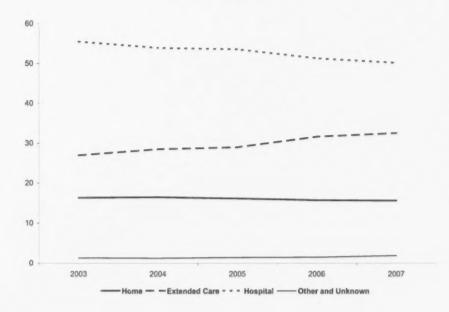

#### Vital Statistics Information Box

# PLACE OF DEATH FOR DEATHS FROM NATURAL CAUSES BRITISH COLUMBIA, 2003 - 2007

Deaths from natural causes in 2003 to 2007 were examined to determine the place of death. The majority of these deaths to BC residents occurred in hospital (52.8 percent over the five year period). About one in six deaths from natural causes (16.0 percent) occurred at home and almost one third (29.8 percent) occurred in extended care facilities.

#### CANCER DEATHS IN BRITISH COLUMBIA, 1992 TO 2007

More British Columbians succumbed to Cancer or Malignant Neoplasms (ICD Codes C00-C97) than any other cause in 2007. The following charts illustrate the trends and changes in deaths caused by Cancer from 1992 to 2007. As illustrated, the proportion of deaths caused by specific types of Cancer has not changed substantially from 1992 to 2007. However, those dying of Cancer in 2007 are older than they were in 1992 and larger shares of them are female. The age standardized death rate has climbed, but the potential years of life lost per 10,000 standard population, PYLL Standard Rate, (PYLLSR) has fallen.

Note: ASMR per 10,000 standard population (Canada 1991 Census). Total percentage may not add up to 100 due to rounding. + Denotes the number of cases is less than five. Non-residents are excluded. Total includes unknown gender. The output from ICD-10 mortality coding and underlying cause of death selection was modified in BC to reflect the intent of certifiers in this jurisdiction and to provide greater continuity over time. Data using the standard ICD-10 rules for such categories as pneumonia/influenza, diabetes, or cancer should not be compared to the numbers shown above.

#### **Leading Causes of Death**

Table 22 shows the 12 leading causes of death in BC. The two leftmost columns list the cause and the corresponding codes in ICD-10. For 2002-2006 period and the year 2007, the following four values are shown: number of deaths, the rank by number of deaths, the ASMR, and the rank by ASMR. The numbers demonstrate the absolute impact of each cause of death by showing how many individuals died from that cause in BC during the time period. The rows of the table are in the order of the 2007 ASMR rank.

For 2007 the 12 leading causes of death shown in Table 22 were responsible for 84.9 percent of all deaths. The top three causes of death were the same for both time periods, not only in the rank by number of deaths, but also in ASMR rank; they are *Malignant Neoplasms*, *Cardiovascular Diseases* and *Cerebrovascular Diseases*. For 2007, these 3 leading causes account for 57.4 percent of all deaths.

Figure 35 shows the number of deaths from Table 22 in 2007 graphically. It shows clearly the impact of the top three categories, causing more than half of all deaths.

Table 23 shows the five leading causes of death in the 7 different age groupings. The leading cause of death among those under 1 year of age (infant mortality), were conditions originating in the perinatal period with a little over 50 percent of the deaths being attributable to this cause. The second most numerous causes of infant death were congenital malformations and chromosomal abnormalities. More than half of all infant deaths occurred in the first 7 days after birth and about two-thirds (66.9 percent) occurred within the first 28 days after birth (see Table 27). Males accounted 62.2 percent of the deaths among those under 1 year of age. Infant mortality is examined in more detail in the next section.

Among children 1 to 14 years old, malignant neoplasms were the most common cause of deaths for both genders. Unintentional injuries claimed more female than male lives whereas congenital malformations and chromosome abnormalities were equally distributed between both genders.

By contrast, unintentional (accidental) injuries were the leading cause of death, particularly for males, in the age groups 15-24 and 25-44. Those causes include events such as motor vehicle accidents, falls, and unintentional poisonings, A more detailed list of the included causes by ICD codes appears in Appendix 2. Counts of death due to unintentional injuries, suicide, and homicide (collectively referred to as "external causes of death") in the current year tend to underestimate the actual figures due to known delays in determining final causes of deaths. As a result it can be anticipated that these numbers will be revised upwards in subsequent annual reports.

Between 15 and 24 years of age, suicides ranked second as the leading cause of death after unintentional injuries (see also Table 35). There were substantially fewer female deaths in this age group as shown in Table 23. In the age group between 25 and 44, malignant neoplasms were second most common cause of death with female deaths outnumbering males and comprising the largest proportion of female mortality in this age group.

Malignant neoplasms were the leading cause of death for those between 45 and 64 years and they claimed a larger number of deaths for males but a greater proportion of female deaths in this age group.

Between 65 and 84 years of age, 35.5 percent of the deaths were due to malignant neoplasms, followed by cardiovascular disease which caused about 1 in 5 deaths (20.7 percent). For those 85 years and older, the relative importance of those 2 cause categories was reversed with cardiovascular disease causing about 1 in 3 deaths (29.5 percent).

Malignant neoplasms were ranked in the first 3 leading causes of death in each age group for those over 1 year of age and were the overall leading cause of death in BC in 2002 to 2006, as well as in 2007 (see Table 22 and Figure 35). Despite this, the age-standardized mortality rates for total malignant neoplasms and for lung cancer have declined over the last 2 decades (see Figures 19 and 20).

#### **Infant Mortality**

BC had lower infant mortality rates than Canada as a whole from 1992 until 2005, the most recent year for which information on Canadian infant mortality rates is available (see Table 5). There were 172 infant deaths in BC in 2007 or 4 deaths per 1,000 live births. The rate 20 years ago was just over eight per 1,000 live births and that has progressively declined to the rates seen in the last few years.

Table 24 shows the number of infants who died in 2007 by birth weight and maternal age group. The first column has the mother's age groups ranging from less than 20 years up to 40 years or older. The infants' birth weights are grouped across the top of the table. Across the bottom and down the right side, the table shows row and column totals, percents, and rates per 1,000 live births. The difference in infant mortality rates across the 3 birth weight categories is quite distinct: for infants with birth weights of 2,500 grams or more, 1.4 per 1,000 live births in the same birth weight category died in their first year. In the 1,500-2,499 gram group the rate was 10.7 per 1,000 live births, and infants who weigh less than 1,500 grams had an infant mortality rate of 203.8 per 1,000 live births.

When these infant deaths are stratified across maternal age, the effect is not so dramatic. Although in 2007 the infant mortality rate to mothers under the age of 20 years was about 3 times the rate to older women, infant mortality was exceptionally low among teenagers in 2000 and 2006 (see Figure 15). In general, from 1986 to 2007, there has been a consistent downward trend in the infant mortality rate for all age groups.

Table 25 repeats the birth weight categories and general format shown in Table 24 but replaces maternal age groups with gestational age. Of the 172 infant deaths in 2007, only 46 were term births (37 to 41 weeks) with birth weights of 2,500 grams or more.

There was a dramatic increase in infant mortality as birth weight and gestational age decreased. More than 2 in 5 (44.8 percent) of infant deaths were extremely premature (less than 28 weeks) and with low birth weight (less than 2,500 grams). About 6 in 10 infant deaths were low birth weight (63.4 percent), more than two-thirds (69.2 percent) were premature (less than 37 weeks) and about 3 in 5 (61.6 percent) were both low birth weight and premature.

Table 26 shows infant mortality in each LHA of the infants' usual residence, for 2002-2006 and for the year 2007. The two columns on the left show the LHA number and name. The three columns for 2002-2006 show the number of infant deaths in the LHA (Observed Deaths), the ratio, and the rate of infant deaths per 1,000 live births. In this period, there were only seven LHAs with statistically significant ratios (five high and two low). For 2007, the table indicates the number of deaths in 3 age ranges, early neonatal (0 to 6 days), neonatal (0 to 27 days), and post-neonatal (28 to 364 days). The last 2 columns indicate the total number of infant deaths, and the infant death rate per 1,000 live births.

Causes of infant deaths and stillbirths are shown in Table 27. Infant death rates are per 10,000 live births and stillbirth rates are per 10,000 total births (live births plus stillbirths). More than half (57.6 percent) of infant deaths in 2007 occurred in the early neonatal period. Of those, 94.9 percent were due to congenital anomalies or perinatal conditions.

TABLE 24

#### INFANT MORTALITY BY AGE OF MOTHER AND BIRTH WEIGHT

BRITISH COLUMBIA, 2007

Age of	1	Birth Weight	(in Grams)			Total

Non-residents are excluded.

#### **Deaths Due to HIV**

Mortality due to Human Immunodeficiency Virus (HIV) peaked in 1994 and has seen a general downward trend since then.

Table 28 shows the number of deaths due to HIV broken out by gender and 6 age groups from 1992 to 2007. The percentage of the total deaths in each year is shown for each age group. At the bottom of the table are counts and percentages for the entire time period. Figure 37 shows that in the period from 2002-2007 most deaths due to HIV disease in BC occurred in individuals who were between 40 and 49 years of age.

Although there were fluctuations in the yearly numbers of HIV deaths in Table 29, numbers have generally decreased each year. The Vancouver HSDA had the highest mortality rate (17.27 deaths per 100,000 population), from 1991 to 2007. In 2007 there were 42 deaths due to HIV in that area, far higher than any other HSDA.

Rate per 100,000 population in specified area. Total percentage may not add up to 100 due to rounding. Non-residents are excluded. N.S. – Not stated.

#### **External Causes of Death**

Table 30 shows the number of deaths for males and females from "external causes" which include unintentional deaths as well as deaths due to suicide, homicide and those where intent was undetermined. Also shown are ASMRs. These rates of death per 10,000 standard population are used to compare statistics from other time periods and other jurisdictions. The *Glossary* explains ASMR and the *Methodology* section gives an example of the calculation method.

During 2007 there were 1,505 deaths due to external causes or approximately 48 external cause deaths for each 1,000 deaths in BC (see Table 30).

The break out by cause was:

- 387 were suicides
- 284 were motor vehicle accidents
- 314 were unintentional falls
- 33 were unintentional drownings
- 24 were homicides
- 208 were due to other external causes
- · 255 were unintentional poisonings

More than two-thirds of deaths by external causes were males as shown in Table 30. The leading four causes of external deaths in males in 2007 (in ASMR rank order) were suicide, motor vehicle accidents, unintentional poisoning (mostly drug overdoses), and unintentional falls. For females, the leading four (in ASMR rank order) were: suicide, unintentional falls, motor vehicle accidents, and unintentional poisoning.

Table 31 shows the allocation of external death causes according to the Local Health Area where the deceased lived, not where the incident occurred. The highest ASMRs in 2007 are found in the following LHAs (with 5 or more deaths): Hope (13.96), Upper Skeena (11.34), Cariboo-Chilcotin (9.80), Vancouver Downtown-Eastside (9.26), and Salmon Arm (7.57).

Table 32 shows number of deaths from suicide classified by month of occurrence and by gender. Percentages across months are also given. In 2007 there were almost three times the number of male suicides than female suicides. The data for 2007 shows that February was the month with the fewest number of suicides (22) while July was the month with the highest number of suicides (43).

TOTAL	283	100.0	104	100.0	387	100.0	

Note: Suicide Deaths – ICD-10 codes X60–X84, Y87.0.

Total percentage may not add up to 100 due to rounding.

Non-residents are excluded.

#### Notes to Table 31

Note: Based on usual residence. ASMR – rate per 10,000 standard population (Canada 1991 Census). PERCENT – Provincial total for each cause as a percent of the Provincial total for all deaths from external causes. Other is comprised of accident caused by machinery, accidental firearm discharge, all other accidents, external event of undetermined intent, and sequelae of other external causes. Total includes residents with unknown LHA.

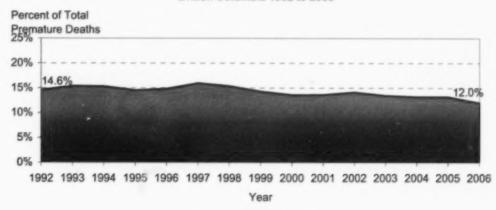

### Vital Statistics Information Box

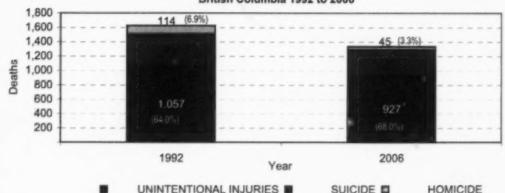

PREMATURE (<75 YEARS) EXTERNAL CAUSES OF DEATH IN BRITISH COLUMBIA, 1992 TO 2006

From 1992 to 2006, deaths among those under the age of 75 have accounted for just 41.3 percent; however, 80.1 percent from external causes were among those under the age of 75. The total number of deaths attributable to external cause has fallen from 2,027 in 1992 to 1,777 in 2006, and among those under the age of 75 the number of deaths has fallen from 1,651 to 1,363. The share of premature deaths attributable to external cause has fallen from 14.6 percent in 1992 to 12.0 percent in 2006. Unintentional injuries account for the vast majority of deaths from external causes of death with 68.0 percent external cause deaths among those under the age of 75 being from unintentional injuries.

### Share of Premature Mortality Attributable to External Causes, British Columbia 1992 to 2006

# Deaths Under the Age of 75 Years due to Unintentional Injuries, Homicide and Suicide, British Columbia 1992 to 2006

### Mortality Due to All Causes of Death

Table 33 shows the number of deaths from all causes in each LHA not only for 2007, but also for the previous 5 year period. The Standardized Mortality Ratio (SMR) columns compare the actual number of deaths in the LHA (observed) with the number that would be expected if the LHA had the same age-specific death rates as the whole province.

Table 33 also shows 95 percent confidence intervals for the SMR, which provides a measure of its variability. In 2007 and the previous 5 years, 39 LHAs had statistically significant ratios: 27 high and 12 low.

In 2007, the LHAs with the 5 highest statistically significant SMR were: Nisga'a (2.57), Vancouver Island North (1.93), Queen Charlotte (1.67), Nechako (1.56) and North Thompson (1.50).

Figure 38 shows the SMRs grouped into colour coded quintiles. The map provides an immediately apparent view of the provincial variation of SMRs. There was no particular pattern although low ratios were concentrated mostly in the southeast and southwest.

### Potential Years of Life Lost

Potential Years of Life Lost (PYLL) gives an indication of "premature" death by totalling the number of years British Columbians "lost" prior to age 75 years. For example, an infant death at the age of 6 months would have lost 74.5 years of life. The upper limit of 75 is used for both genders. PYLL indicates the importance of the various causes of premature death by giving more weight to deaths that occurred at younger ages than those that occurred later in life. Bear in mind that the PYLL weighted according to age. Thus a death at a younger age contributes more to total PYLL than a death at an older age.

The tables and figures in this section portray the impact of premature mortality. The *Glossary* further defines *PYLL*. The precise calculation methods for the various indicators derived from PYLL are referenced in the tables in this section and are shown in the *Methodology* section.

Table 34 shows several PYLL based indicators for deaths of those under 75 years old contrasted with total deaths and ASMR for all ages for various causes of death. The *No. of Deaths* column shows the number of persons under 75 years of age who have died due to each cause group. Total PYLL measures the total years all decedents would have lived had they reached the age of 75. Percent of PYLL shows each disease category's proportion of the Total PYLL for all causes. Average PYLL is the disease category's Total PYLL divided by number of deaths. PYLLSR is the rate of PYLL per 1,000 standard population. See *PYLL Standardized Rate* in the *Glossary* and the *Methodology* section for computation details.

Because PYLL focuses on premature mortality rather than on the simple fact of death, it is useful in assessing causes of death in terms of the extent to which each contributes to reduction in lifespan. In Table 34 the column labelled Average PYLL is helpful in exploring this effect. A larger value in this column indicates a more premature death due to this category.

Motor vehicle accidents, which claim many young lives, have a high value for average PYLL at 37.2 years. Malignant neoplasms, on the other hand, although claiming many lives (4,595 under the age of 75) have a relatively low average PYLL at 12.7 years since malignant neoplasms tend to afflict older individuals more frequently.

Figure 39, by directly and visually contrasting PYLLSR and ASMR for several major causes of death, allows one to compare the profiles of the two sides of the graph, where there are significant differences in the impact of the various causes of death on PYLL and overall death rate. The clearest contrast is for external causes of death: a relatively moderate ASMR but very high PYLLSR. This clearly shows the contribution of "external causes" to premature mortality.

In Table 35, causes of death in 2007 have been ranked according to the Total PYLL for all genders in 4 age groups. The central portion of the table indicates the number of deaths and number of years lost for males, females, and both genders. The PYLL column shows all the years lost in the age group due to each cause category. PYLL % indicates the percent of all PYLL in the age group due to each cause.

Most of the PYLL under 15 years was due to conditions originating in the period around birth (see Table 35). The majority of those deaths occurred less than 7 days after birth (see Table 27) and were more frequent among males than females (see Table 21).

Motor vehicle accidents (MVA) had the highest PYLL in the age group of 15 to 24 year olds. Most of these deaths were to males and therefore the majority of the PYLL in this age group was attributable to males as shown in Table 35.

In the age group of 25 to 44 year olds, among females, malignant neoplasms were responsible for almost the same number of PYLL as all the other major causes combined. Among males, suicides accounted for the largest number of PYLL, although PYLL due to MVA and malignant neoplasms were high among males as well. Note that male deaths due to MVA were responsible for a greater number of deaths than in the 15 to 24 year age group but fewer PYLL.

Malignant neoplasms accounted for the largest share of PYLL for both genders in the 45-74 year age group (see Table 35).

Figure 40 presents the PYLLSR values from Table 35 so the gender differences are immediately apparent.

Males in the four age groups have a higher PYLL than females, although the standardized PYLL rates due to malignant neoplasms were similar in the two adult age groups.

External causes have been covered in a previous section but Table 36 presents their geographic distribution in terms of PYLL index. These causes, in general are considered to be more preventable than 'natural' causes of death and therefore attract attention because of the greater potential for their reduction.

Table 36 shows PYLL due to external causes of death by LHA for the period 2002 through 2006 and for the year 2007. It also displays the observed number of years of lost life in each LHA for both periods and, for 2007, the expected PYLL based on the age distribution in the LHA adjusted to the provincial age and gender specific rate.

The PYLL Index is the ratio of observed to expected deaths. The (p) column displays a '\*' or '+' when the ratio falls outside of a 95 percent confidence interval. PYLL index is useful for comparing a region's PYLL experience to the Province. However, PYLLSR is preferred when making comparisons to other regions. See Expected Potential Years of Life Lost and PYLL Index (PYLLI) in the Glossary and the Methodology section for a computational example.

In the 5 year period, over half of the LHAs (47) had statistically significant observed versus expected deaths and 33 of those were high. Only one of the more densely populated areas in the lower mainland (Vancouver Downtown Eastside) was statistically significant and high.

Figure 41 displays BC's 89 LHAs, coloured according to their level of PYLLI for the years 2002-2006. They are grouped into quintiles, five groups from those with the lowest (dark grey) to those with the highest PYLLI values (deep red). Looking at this map, the pattern is one of an urban/rural distinction. The more urban areas, in general, are in the quintiles with lower PYLLI values.

TABLE 34

### POTENTIAL YEARS OF LIFE LOST AND AGE STANDARDIZED MORTALITY RATES BY SELECTED CAUSES OF DEATH

BRITISH COLUMBIA, 2007

Note: PYLL - denotes the total number of years of life lost from an established life expectancy (75 years).

PYLL=denotes the total number of years of life lost from an established life expectancy (75 years).

PYLLSR – PYLL per 1,000 standard population (Canada 1991 Census).

ASMR – per 10,000 standard population (Canada 1991 Census).

Other causes includes undetermined and pending.

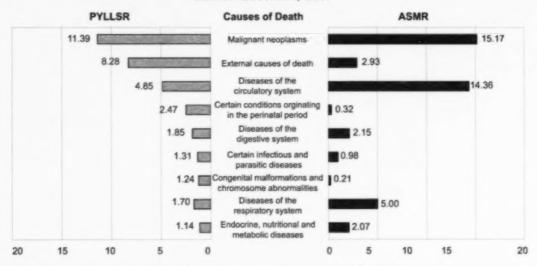

Total percentage may not add up to 100 due to rounding. Non-residents are excluded.

The output from ICD-10 mortality coding and underlying cause of death selection was modified in BC to reflect the intent of certifiers in this jurisdiction and to provide greater continuity over time. Data using the standard ICD-10 rules for such categories as pneumonia/influenza, diabetes, or cancer should not be compared to the numbers shown above.

### FIGURE 39

## POTENTIAL YEARS OF LIFE LOST AND AGE STANDARDIZED MORTALITY RATES BY SELECTED CAUSES OF DEATH

BRITISH COLUMBIA, 2007

Note: PYLLSR - Potential Years of Life Lost Standardized Rate (age under 75 years) per 1,000 standard population.

ASMR - Age Standardized Mortality Rate per 10,000 standard population.

PROVINCIAL TOTAL

Notes for this table follow the map.

FIGURE 41
EXTERNAL CAUSES OF DEATH BY LOCAL HEALTH AREA

# inset 1

PYLL - denotes the total number of years of life lost from an established life expectancy (75 years).

PYLLSR - per 1,000 standard population (Canada 1991 Census).

\* Statistical testing indicates that observed deaths are significantly different from the expected deaths (p<0.05, two tailed). \* Denotes significance based on less than five deaths.

Total includes residents with unknown LHA.

Note: PYLLI - Potential Years of Life Lost Index. Refer to Figure 1 to clarify geographical location of LHAs.

EXTERNAL CAUSES OF DEATH (AGE UNDER 75 YEARS), BRITISH COLUMBIA, 2002-2006 AND 2007 POTENTIAL YEARS OF LIFE LOST BY LOCAL HEALTH AREA

### FIGURE 41

### EXTERNAL CAUSES OF DEATH BY LOCAL HEALTH AREA

BRITISH COLUMBIA, 2002-2006

# Inset 1

### Notes to Table 36

PYLL - denotes the total number of years of life lost from an established life expectancy (75 years).

PYLLSR - per 1,000 standard population (Canada 1991 Census).

\*Statistical testing indicates that observed deaths are significantly different from the expected deaths (p<0.05, two tailed). + Denotes significance based on less than five deaths.

Total includes residents with unknown LHA.

Note: PYLLI - Potential Years of Life Lost Index. Refer to Figure 1 to clarify geographical location of LHAs.

### **Medically Treatable Diseases**

A list of causes has been identified where death could potentially have been avoided through appropriate and timely medical intervention and treatment. It should be noted that the causes are considered to have been amenable to medical treatment only if the death occurred to persons within specific age ranges. Please see the footnote on Table 37 for a list of the causes and ages included in this category.

There were only 145 deaths due to these causes in 2007, which represents 0.47 percent of all deaths in the province.

Table 37 indicates the number and percent of all medically treatable disease (MTD) deaths by cause for 2007 and the five-year period 2002-2006. Bacterial infections accounted for most of the deaths due to MTDs in 2007 and the previous five years. In 2007, two cause categories, *Hypertension and Hypertensive Diseases*, and *Pneumonia and Unqualified Bronchitis*, accounted for almost 2 in 5 male deaths due to MTDs (37.9 percent) and for females, about 1 in 5 (21.5 percent).

Table 38 shows the count of deaths due to MTDs organized by the LHA in which the decedent lived. For the current year, 2007, the table shows the actual number of deaths observed in the LHA and the expected deaths (calculated using the 2007 age specific death rates for MTD).

There were 8 LHAs that had no deaths due to these conditions in 2002-2006 and 42 in 2007 as shown in Table 38. Further, there were only eight LHAs in 2002-2006 that showed differences between observed and expected deaths that were statistically significant based on five or more deaths and only three LHAs with five or more deaths had a statistically significant and high ratio in 2007.

Figure 42 shows the province divided up into its 89 LHAs, with each area indicated as to whether its SMR for deaths due to MTDs was high or low on a five category scale: deep red indicates the highest SMRs and dark grey indicates the lowest. As might be expected from a table containing such low counts, this map shows no obvious geographic pattern of location of the quintiles.

### TABLE 37

### DEATHS DUE TO MEDICALLY TREATABLE DISEASES BY SELECTED CAUSES AND GENDER

BRITISH COLUMBIA, 2002-2006 AND 2007

						20	07		
		2002-	2006	Ma	ile	Fen	nale	To	tal

TOTAL		817	100.0	66	100.0	79	100.0	145	100.0

Note: Medically Treatable Diseases (MTDs) based on Charlton's definition (see Glossary).

\*ICD-10 codes A00-A05, A20-A49, B95-B96, G00, H66, H70, H95.0-H95.1, I00-I01, I02.0, I02.9, L01-L08, M00, M02.8-M02.9, M46.2,

Deaths due to MTDs exclude all deaths less than age 5 years old.

Deaths due to MTDs also exclude
- deaths aged 65 or more from hypertensive disease.

- deaths aged 50 or more from pneumonia and unqualified bronchitis.
- deaths aged 65 or more from cervical cancer.
- deaths aged 65 or more from tuberculosis.
- deaths aged 50 or more from asthma.
- deaths aged 45 or more from chronic rheumatic heart disease.
- deaths aged 50 or more from acute respiratory infections and influenza.
- deaths aged 65 or more from bacterial infections.
- deaths aged 35 or more from Hodgkin's disease.
- deaths aged 65 or more from abdominal hernias, cholecystitis and cholelithiasis, appendicitis.
- deaths aged 65 or more from deficiency nutritional anemias. Total percentage may not add up to 100 due to rounding.

The output from ICD-10 mortality coding and underlying cause of death selection was modified in BC to reflect the intent of certifiers in this jurisdiction and to provide greater continuity over time. Data using the standard ICD-10 rules for such categories as pneumonia/influenza, diabetes, or cancer should not be compared to the numbers shown above. Table 8

### DEATHS DUE TO MEDICALLY TREATABLE DISEASES BY LOCAL HEALTH AREA

BRITISH COLUMBIA, 2002-2006 QUINTILE (SMR) 5 (> 1.61) 4 (1.00 - 1.61) 3 (0.86 - 1.00) 2 (0.53 - 0.86) 1 (< 0.53) Statistically Significant 100

Inset 2

Notes to Table 38
MTDs based on Charlton's definition (see glossary - Medically Treatable Diseases).
"Statistical testing indicates that observed deaths are significantly different from the expected deaths (p<0.05, two tailed).
+Denotes significance based on less than five deaths. Total includes residents with five deaths. Total includes residents with unknown LHA.

Note: Refer to Figure 1 to clarify geographical location of LHAs.

### Alcohol-Related Deaths

Alcohol-related deaths provide information on deaths due to alcohol (directly related) as well as those where alcohol was a contributing factor (indirectly related). Alcohol-related and drug overdose deaths are the only cause of death categories that are not based entirely upon the underlying causes of death. See the *Glossary* for a further explanation of alcohol-related deaths and Table 39 for the list of causes used for deaths directly due to alcohol.

Table 39 shows the number and percent of deaths that were directly and indirectly related to alcohol in 2007 and in the 5 preceding years, while figure 43 graphically shows the pattern of alcohol-related deaths by cause. About one-fifth (22.4 percent) of the 1,993 deaths related to alcohol in 2007 were directly attributable to alcohol (447 deaths). Alcohol was a contributing factor in the remaining 77.6 percent of these deaths. The table indicates that most of the deaths directly attributable to alcohol were caused by liver disease (14.9 percent).

Table 40 shows numbers and percentages of alcohol-related deaths by age group for males, females, and the total population. All alcohol-related deaths, whether directly or indirectly related to alcohol are included in this table.

Alcohol-related deaths constitute 6.4 percent of all deaths in 2007 and 9.2 percent of all male deaths. Males died of such causes nearly three times more frequently as women in 2007.

Nearly half (44.6 percent) of all alcohol deaths were of seniors (65 or older); 40.9 percent were people between the ages of 45 and 64.

The numbers of deaths directly and indirectly related to alcohol are shown for the LHAs in Table 41.

There were 22 LHAs with at least 5 deaths where the observed values were statistically significant and above the expected values in both 2002-2006 and 2007 as shown in Table 41. There were nine LHAs with SMRs that were statistically significant and low in both time periods. The map in Figure 44 shows the SMR quintiles and statistical significance patterns in each LHA during 2002-2006.

Reports of alcohol-relatedness for deaths in 2007 are lower than in previous years. Many alcohol-related deaths are referred to the BC Coroner service for investigation. As with external causes of death, the medical coding will be incomplete until the Coroner closes the investigation. For this reason the counts are often lower in the current year and are adjusted upwards in the years that follow.

### TABLE 39 ALCOHOL-RELATED DEATHS BY CAUSE

BRITISH COLUMBIA, 2002-2006 AND 2007

			Year of D	eath	
		2002-	-2006	20	07

Homicide	X85-Y09, Y871	59	0.6	3	0.2
All other causes		317	3.2	203	10.2
SUBTOTAL		8,040	81.8	1,546	77.6
TOTAL		9,823	100.0	1,993	100.0

Note: <sup>1</sup>ICD-10 codes for indirectly related to alcohol exclude the codes for directly related to alcohol and will not match the list of codes used for these categories in other tables.

Total percentage may not add up to 100 due to rounding. Non-residents are excluded.

Coding practices from 1995 to 1999 may have produced over-counting of alcohol-related mortality. With the introduction of ICD-10 in 2000, more specific codes are available. Currently produced data should not be used in combination with data produced prior to 2000. The output from ICD-10 mortality coding and underlying cause of death selection was modified in BC to reflect the intent of certifiers in this jurisdiction and to provide greater continuity over time. Data using the standard ICD-10 rules for such categories as pneumonia/influenza, diabetes, or cancer should not be compared to the numbers shown above.

# FIGURE 43 ALCOHOL-RELATED DEATHS BY CAUSE BRITISH COLUMBIA, 2007

Certain infectious and parasitic diseases (2.7%) Neoplasms (12.6%) Directly Related to Alcohol (22.4%) Endocrine/Nutritional/ Metabolic (2.9%) Mental disorders (1.4%) Indirectly Related to Alcohol (77.6%) Neurological diseases (1.3%) Alcoholic gastritis (0.1%) Alcohol induced chronic pancreatitis (0.1%) Alcohol poisoning (0.3%) Circulatory (19.0%) Alcoholic cardiomyopathy (0.9%) Alcoholic intoxication (1.6%) Alcoholic psychoses and dependence (6.9%) Diseases of the respiratory system (7.3%)Digestive system Alcoholic liver disease (9.6%) diseases (4.6%) Urinary system diseases (1.1%) Unintentional injury (10.9%) Suicide (3.7%) Homicide (0.2%) All other causes (10.2%)

See Table 39 for ICD-10 codes for each category.

Notes for this table follow the map.

FIGURE 44 ALCOHOL-RELATED DEATHS BY LOCAL HEALTH AREA

### Notes to Table 41

Note: \*Statistical testing indicates that observed deaths are significantly different from the expected deaths (p<0.05, two tailed).

+Denotes significance based on less than five deaths. Coding practices from 1995 to 1999 may have produced over-counting of alcohol-related mortality. With the introduction of ICD-10 in 2000, more specific codes are available. Currently produced data should not be used in combination with data produced prior to 2000.

Note: Refer to Figure 1 to clarify geographical location of LHAs.

### **Smoking-Attributable Deaths**

Table 42 and Figure 45 portray the number and percent of deaths in 2007 that were attributable to smoking for those 35 years old and older. The age restriction relates to the fact that smoking-attributable conditions generally become apparent over time and after several years of tobacco use. Because the decedent's smoking history is not available on the death record, the link between smoking and mortality is estimated indirectly. Research has indicated the fraction of deaths from certain diseases, like lung cancer, that are due to smoking and that fraction is then used to estimate the number of smoking attributable deaths due to those diseases. See the *Glossary* entry on *Smoking-Attributable Mortality* (*SAM*) for details and the *Methodology* section for the calculation formulae for these indicators.

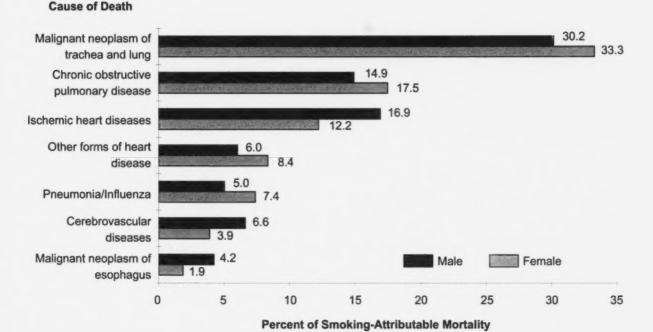

Figure 45 shows the smoking attributable portion of each of 7 cause of death categories selected according to highest SAM number from Table 42.

Table 42 shows the number of deaths by causes and the percentage and number of those deaths that are attributed to smoking. Also shown is percentage total SAM by cause category.

In 2007, 6,138 deaths were attributed to the smoking as shown in Table 42. By far the largest contributory cause was *Malignant Neoplasms of the Trachea and Lung* (31.4 percent) followed by *Chronic Obstructive Pulmonary Disease* (16.0 percent) and *Ischemic Heart Disease* (15.1 percent).

# FIGURE 45 SMOKING-ATTRIBUTABLE MORTALITY BY SELECTED CAUSES AND GENDER

BRITISH COLUMBIA, 2007

Note: Ischemic heart disease includes 35-64 years and 65+ years. Cerebrovascular disease includes 35-64 years and 65+ years.

Note: Deaths are the total number of deaths aged 35+ years or as specified in the diagnostic category.

SAM – derived by multiplying the SAM(%) by the number of deaths in each category.

See glossary under Smoking-Attributable Mortality Percent for a definition of the formula for SAM(%).

Non-residents are excluded.

The output from ICD-10 mortality coding and underlying cause of death selection was modified in BC to reflect the intent of certifiers in this jurisdiction and to provide greater continuity over time. Data using the standard ICD-10 rules for such categories as pneumonia/influenza, diabetes, or cancer should not be compared to the numbers shown above.

\*Total and Subtotal SAM numbers may not add up due to rounding.

### **Drug-Induced Deaths**

Drug-induced deaths are all deaths directly due to drug use, and including use of illicit or prescribed drugs. This category excludes causes indirectly related to drug use and also excludes those deaths due to alcohol or smoking. See Table 44 for a list of the drug-induced death categories.

Table 43 shows that males (206 deaths) were more likely to die of drug-induced causes than females (128 deaths). 293 of the drug-induced deaths (87.7 percent) were among individuals aged 25 to 64 years. More than half of these deaths (158) were in the 45 to 64 year age-group.

Table 44 presents drug-induced deaths by cause for 2002-2006 and 2007. About two-thirds of those deaths in 2007 (66.8 percent) and in the previous 5 years, 2002-2006 (65.7 percent) were the result of unintentional poisoning by drugs. Of the 387 suicide deaths in BC in 2007, 18.6 percent were drug-induced.

Figure 46 is a graphic presentation of the results from Table 44. In 2007, drug-induced deaths were almost all due to poisoning, either unintentional or suicide.

Table 45 shows the number of observed and expected drug-induced deaths and the ratio of observed to expected deaths (SMR) in each LHA in 2007 and in the previous 5 years. Notice that 30 LHAs had no drug-induced deaths in 2007 and 7 had no drug-induced deaths in 2002-2006. Vancouver's City Center and Vancouver's Downtown East Side were the only 2 LHAs where the observed number was statistically significant and higher than the expected number (SMR ratio) in 2007 and the previous 5 years.

Figure 47 maps the variation of SMRs in the LHAs divided into quintiles for 2002-2006.

TABLE 43

DRUG-INDUCED DEATHS BY AGE AND GENDER
BRITISH COLUMBIA, 2007

	M	ale	Fem	ale	Tot	al

DRUG-INDUCED DEATHS BY LOCAL HEALTH AREA

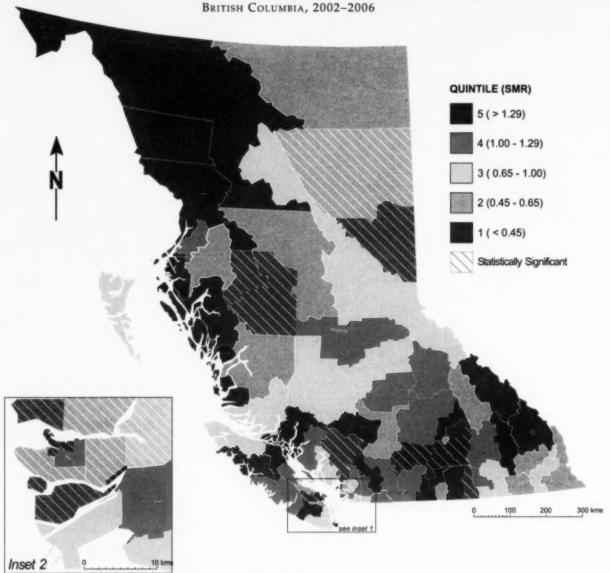

Note: Refer to Figure 1 to clarify geographical location of LHAs.

## **Drug Overdose Deaths**

This section provides information on deaths due to unintentional poisoning by illicit/illegal drugs. These deaths are a small portion of deaths due to unintentional poisoning by drugs, and exclude accidental poisoning by drugs in therapeutic use.

Data on unintentional illicit/illegal drug deaths are retrieved from the Coroners' Medical Certificate of Death. This section only considers deaths where an overdose occurred and was determined to be the underlying cause of death. Deaths due to conditions that may arise from substance abuse, such as Hepatitis 'B' and 'C' and HIV, are excluded from consideration.

Among the substances implicated in these overdoses there are those generally referred to as "illicit drugs" – heroin, cocaine, and "psychostimulants with abuse potential" including "crystal meth" (methamphetamine hydrochloride) and "ecstasy" (methylenedioxy-methamphetamine). A more precise term for these chemicals might be "illegal" drugs as there is no medically recognized, legal use for either "ecstasy" or "crystal meth". Although both heroin and cocaine have very limited therapeutic uses, in circumstances where a fatal overdose has occurred it is almost certain that these drugs would have been obtained via illegal means.

On the other hand, where morphine is implicated, it is possible that some of the deaths involved legally obtained drugs because morphine is prescribed for chronic and/or severe pain (such as that associated with advanced cancer) and if taken improperly could result in an unintentional overdose. Unfortunately it is not always possible to differentiate whether an opiate overdose was caused by heroin or morphine, as the information received on the Coroners' final reports does not consistently differentiate. Often coroners record "morphine type" overdose, hence the label "heroin/morphine type".

Although methadone is often used legally in the treatment of opiate addiction, a number of deaths are occurring as the result of unintentional methadone overdoses. Therefore it would appear that methadone is being used in unsanctioned ways resulting in death.

Table 46 shows that deaths due to unintentional overdoses are not confined to any one area in the province. ASMRs for 2007 at the time of reporting appear to have declined in all areas except the Northern Health Authority. However, as with other externally caused deaths, reporting is often delayed due to the time required for coroners to complete and report their findings to the Agency. Therefore these results should be viewed with caution.

Table 47 and Figure 48, depict a general decline in drug overdose fatalities. The ASMR has been consistently much higher for males than for females.

# ASMR FOR UNINTENTIONAL ILLICIT/ILLEGAL OVERDOSE DEATHS BY GENDER

BRITISH COLUMBIA, 2001-2007

See Table 47 for notes.

#### Accidental Falls Deaths

In 2007, there were 1,505 deaths due to external causes among BC residents and of these, unintentional (accidental) deaths comprised over 71 percent (1,079) of non-natural deaths. Overall, falls were the leading cause of unintentional death, contributing almost 30 percent to this category in 2007, exceeding fatal motor vehicle incidents in number (314 vs. 284), see Table 30. However, analysis of various causes of unintentional (accidental) mortality in 2007 shows that females were far more likely to die as the result of a fall than males. Only 22 percent of unintentional deaths among males were the result of falls. That proportion rose to just over 41 percent among females.

While fatal falls occur across the lifespan of British Columbians, the elderly are far more likely to succumb to the effects of a fall.

The data discussed so far only include events where the fall was determined to be the underlying cause of death (that is – the event that was directly responsible for the individual's demise). There are additional deaths that involve accidental falls, but where the fall was considered to be a contributing factor, not the direct cause of death.

Table 48 and Figure 49 show how age specific rates compare between the 2 categories (direct and indirect) of fall-related deaths in BC for individuals aged 60 and older. Clearly, if deaths indirectly caused by falls are included in total falls-related mortality, the extent of the lethal effect of falls among the elderly becomes far greater, and especially so for those 80 years and older.

The BC Injury Research and Prevention Unit (BCIRPU) is a national leader in falls injury research and in the design and implementation of falls prevention strategies. A summary of the initiatives undertaken by the BCIRPU can be viewed at the Unit's website: http://www.injuryresearch.bc.ca/index.aspx go to "Falls Prevention" in the "Injury Topics" menu.

# Marriage-related Statistics

# Vital Statistics Information Box

# MARRIAGES BY OTHER NON CHRISTIAN DENOMINATIONS

BRITISH COLUMBIA, 2007

Table 52, Religious Representatives on Register and Marriages Performed by Religious Denomination uses religious denomination categories from Statistics Canada. In 2007, a total of 1,161 marriages in BC were solemnized by representatives of Other Non Christian religions. The table below provides additional details about these marriages.

Religious Denomination	Number of Religious Representatives	Number Who Performed Marriages	Number of Marriages Performed
Baha'i	114	29	42
Buddhist	26	9	17
Hindu	30	16	65
Muslim	40	25	158
Sangam	10	4	13
Sikh	143	48	535
Spiritualist	80	43	308
Wiccan	15	9	14
Other*	41	9	9
Total Other Non Christian Religions	499	192	1,161

Note: \*Other consists of religious denominations where the representatives performed less than 5 marriages in 2007: Eckankar, Konko-Kyo, Scientology, and Zoroastrian.

# Marriage Introduction

The *Agency* records all marriages that occurred in BC. Unlike the birth and death statistics, which are based on usual residence, marriage information includes all marriages performed in the province whether the parties were residents or non-residents. The *Agency* does not record divorce decrees. The tables in this section contain information about marriages by previous marital status, ages of the parties involved, and type of ceremony. To avoid double counting, the cells in tables 50 and 51 provide information for each combination of marital status or age.

In Table 50 the 22,961 marriages are categorized by the previous marital status of each partner. In 2007, 64.5 percent (14,822) of couples were marrying for the first time and in 19.1 percent (4,380) 1 of the partners was marrying for the first time. There were 2,978 marriages (13.0 percent) where both partners were previously divorced.

Table 51 shows number of marriages by ages of those marrying in 2007. There were 7,383 marriages (32.2 percent) where both parties were in their twenties and 4,220 marriages (18.4 percent) where both parties were in their thirties. There were also 385 marriages (1.7 percent) where at least 1 party was in their teens and 1,160 marriages (5.1 percent) where at least 1 of those marrying was 60 years or older.

Table 52 indicates that there were 7,501 registered religious representatives in BC but less than half of them (3,115) solemnized marriages in 2007. In total, 8,745 (38.1 percent) of all marriages in 2007, were solemnized by religious representatives.

Table 53 shows the number of marriages performed by marriage commissioners, both private and public servant, and the number of each type of commissioner with appointments in 2007.

Reviewing Tables 52 and 53, in 2007, 61.9 percent of marriages were of the civil type, performed by commissioners. Since 1988, when 42.5 percent of marriages were performed by commissioners, the percentage of marriages that were of the civil type has risen quite steadily.

Glossary

# Glossary Terms

# ACQUIRED IMMUNODEFICIENCY SYNDROME (AIDS)

(See HIV Disease.)

# AGE-SPECIFIC FERTILITY RATE (ASFR)

The rate of live births per 1,000 women for the specific age group. This is a more detailed measure than the crude birth rate, as it reflects variations in the birth rate by age groups of the female population.

(See ASFR under Fertility Rate in the Methodology section for an example.)

#### **AGE STANDARDIZATION**

Age standardized is a method of calculation which adjusts a statistical measure for differences in the age/gender structures between populations. With standardized measures, more meaningful comparisons can be made between genders, different time periods, or geographic areas, because the age standardized statistic is calculated as if all populations had the same age/gender population distribution.

The age standardized measures in this report include Age Standardized Mortality Rate (ASMR), Standardized Mortality Ratio (SMR), Potential Years of Life Lost Standardized Rate (PYLLSR), and Potential Years of Life Lost Index (PYLLI). (See the above headings in the Methodology section for examples.)

## AGE STANDARDIZED MORTALITY RATE (ASMR)

A summary of age adjusted death rates by age and gender, which have been standardized to a 'standard' population (1991 Canada Census) for the purpose of rate comparisons between genders, different time periods or different geographic locations. The ASMR is the theoretical number of deaths that would occur per 10,000 population, if the specific population had the same age structure as the standard population. Age standardization is used for comparisons because populations vary in the proportions of the various ages of the individuals that comprise them, and such differences would in themselves tend to affect the disease occurring in each of the populations.

(See also **Age Standardization** and **Standard Population**. See **Age Standardized Mortality Rate** in the Methodology section for an example.)

#### **AIDS**

(See HIV Disease.)

#### ALCOHOL-RELATED DEATHS

Alcohol-related deaths include deaths where alcohol was a contributing factor (indirectly related) as well as those due to alcohol (directly related). Alcohol-related and drug overdose deaths are the only cause of death categories that are not based entirely upon underlying causes of death.

The ICD-10 codes for deaths due to the use or abuse of alcohol (directly related) are shown in Table 39. If any of the conditions listed as directly related to alcohol are noted on the Medical Certificate as antecedent causes giving rise to the underlying cause or as other significant conditions contributing to the death, the death is considered to be indirectly related to alcohol.

Coding practices from 1995 to 1999 may have produced over-counting of alcohol-related mortality. With the introduction of ICD-10 in 2000, more specific codes are available. Currently produced data should not be used in combination with data produced prior to 2000.

#### ASFR

(See Age Specific Fertility Rate.)

#### **ASMR**

(See Age Standardized Mortality Rate.)

#### **AVERAGE AGE**

The average ages of brides, grooms, and mothers of newborns in this annual report are calculated based on information provided on marriage or birth registration forms. The average ages of the population living in data dissemination areas are based on the mid-year population estimates for five-year age groups.

#### **AVERAGE AGE POPULATION**

The average age of the population is a grouped average based on the mid-year population estimates for five-year age groups. This information is provided by BCSTATS, Ministry of Labour and Citizens' Services.

#### **BIRTH ORDER**

Denotes the number position of the present birth relative to previous live births. That is, whether the live birth being counted is the 1st, 2nd, 3rd, etc. live born infant to a particular mother.

#### **BIRTH RATE**

The number of live births divided by the mid-year population and converted to a rate per 1,000 population.

#### **BIRTH RELATED STATISTICS**

The birth related statistics shown in this report include teenage mother, elderly gravida, C-section, low birth weight, and pre-term live birth rates.

#### **BIRTH WEIGHT**

The first weight of the fetus or newborn after birth. For live births this weight should be measured within the first hour of life before significant postnatal weight loss has occurred. Hospitals in BC measure weight in grams; the approximate equivalents in imperial measures are included below for comparisons to other jurisdictions. For statistical and risk assessment purposes, birth weights are grouped as:

Low Birth Weight (LBW) less than 2,500 grams (< 5 lb 8 oz)</li>
"Healthy" Weight 2,500 to 4,499 grams (5 lb 8 oz - 9 lb 15 oz)
High Birth Weight 4,500 grams or more (> 9 lb 15 oz)

Low birth weight is sometimes further divided into these overlapping categories:

Extremely Low Birth Weight less than 500 grams (< 1 lb 2 oz)</li>
 Very Low Birth Weight less than 1,500 grams (< 3 lb 5 oz)</li>

In recent years there has been an increasing preference to identify high birth weight as Large for Gestational Age, which is above the 90th percentile of the birth weight distribution at each gestational age.

#### BIRTHS

(See Total Births.)

#### BREECH

A delivery in which the buttocks or feet appear first. See also **Mode of Delivery**.

#### **C-SECTION**

A delivery by cesarean, involving the surgical incision of the abdomen and uterine walls. See also **Mode of Delivery**.

#### **C-SECTION RATES**

The number of live births, delivered by cesarean divided by the number of live births and converted to a rate per 1,000 live births.

#### CESAREAN

A delivery involving the surgical incision of the abdomen and uterine walls. See also **Mode of Delivery**.

#### **COMMUNITY**

A geographical area defined by a municipal (city, town, village, district municipality, Indian Government district, island minicipality, or resort municipality) boundary. In this report, data are only provided for incorporated communities.

#### **CONFIDENCE INTERVAL**

A measure of the variability of a statistic. A wide confidence interval indicates that the statistic is likely to fall within a wide range of values, while a narrow confidence interval indicates the statistic is likely to fall within a narrow range of values. In general, statistical confidence intervals will be wider for areas with small populations or rare events than for areas with larger populations or more common events. (See Statistical Tests of Significance at the end of the Methodology section.)

#### **CONGENITAL ANOMALIES**

Physical defects that existed or date from birth.

#### **CRUDE RATES**

#### For live births:

the crude rate is the number of live births divided by the mid-year population and converted to a rate per 1,000 population.

For birth-related statistics (teenage mother, elderly gravida, C-section, low birth weight, and pre-term): the rate is the number of these births divided by the number of live births and converted to a rate per 1,000 live births.

#### For stillbirths and perinatal deaths:

the rate is the number of stillbirths or perinatal deaths divided by the number of total births (live births plus stillbirths) and converted to a rate per 1,000 total births.

#### For infant deaths:

the crude rate is the number of infant deaths divided by the number of live births and converted to a rate per 1,000 live births.

#### For maternal deaths:

the rate is the number of maternal deaths divided by the number of live births, and converted to a rate per 10,000 live births.

# For deaths and mortality statistics:

the crude rate is the number of deaths divided by the mid-year population and converted to a rate per 1,000 population.

#### For marriages:

the crude rate is the number of marriages divided by the mid-year population and converted to a rate per 1,000 population.

#### **DEATH RATE**

The number of deaths divided by the mid-year population and converted to a rate per 1,000 population.

#### DEATHS DUE TO MEDICALLY TREATABLE DISEASES

(See Medically Treatable Diseases.)

#### **DRUG-INDUCED DEATHS**

Deaths due to drug-induced causes. This category of deaths excludes unintentional injuries, homicides, and other causes that could be indirectly related to drug use. Deaths directly due to alcohol are also excluded. The causes of death classified as being drug-induced (shown in Table 44 with their ICD-10 codes) are based on those used by the National Center for Health Statistics.<sup>1</sup>

#### DRUG OVERDOSE DEATHS

Deaths where the underlying cause of death was determined to be unintentional poisoning by illicit/illegal drugs. These deaths are a small portion of the deaths due to unitentional poisoning by drugs, and exclude accidental poisoning by drugs in therapeutic use. Deaths due to conditions that may arise from substance abuse, such as Hepatitis 'B' and 'C' and HIV, are also excluded.

Drug overdose deaths can be divided according to drug type: heroin/morphine, methadone, cocaine, psychostimulants including "crystal meth" (methamphetamine hydrochloride) and "ecstasy" (methylenedioxymethamphetamine), and other mixed drugs. The ICD-10 codes for these deaths are shown in Table 46. It should be noted that specified drug (nature of injury) codes must also be listed on the Medical Certificate for the death to be considered a drug overdose.

#### **EARLY NEONATAL DEATH**

Death of a child under seven days of age. See also **Infant Death**.

#### **ELDERLY GRAVIDA**

Any woman who was 35 years of age or older at the time of delivery of a live born infant.

#### **ELDERLY GRAVIDA RATE**

The number of live births delivered by women aged 35 years or older divided by the number of live births and converted to a rate per 1,000 live births.

#### **EXPECTED CESAREAN BIRTHS**

The number of live births delivered by cesarean section that would be expected to be born to residents of a sub-provincial geographic area, based on the C-section rate for the province as a whole, and the number of births in the sub-provincial geographic area.

(See Observed versus Expected Ratio in the Methodology section for an example.)

### **EXPECTED DEATHS**

The number of deaths expected for residents of a sub-provincial geographic area, based on the age specific mortality rates for the province as a whole and the population age structure of the sub-provincial geographic area. (See **Standardized Mortality Ratio** in the Methodology section for an example.)

#### EXPECTED LOW BIRTH WEIGHT

The number of live births with low birth weight (less than 2,500 grams) that would be expected to be born to residents of a sub-provincial geographic area, based on the low birth weight rate for the province as a whole, and the number of live births in the sub-provincial geographic area.

(See Observed versus Expected Ratio in the Methodology section for an example.)

#### EXPECTED MATERNAL COMPLICATIONS

The number of live births with maternal complications that would be expected to be born to residents of a sub-provincial geographic area, based on the complication rate for the province as a whole, and the number of live births in the sub-provincial geographic area.

(See Observed versus Expected Ratio in the Methodology section for an example.)

National Center for Health Statistics (1993). Technical notes. Monthly Vital Statistics Report. 41 (Suppl. 7), 48.

#### **EXPECTED PERINATAL COMPLICATIONS**

The number of live births with perinatal conditions that would be expected to be born to residents of a sub-provincial geographic area, based on the rate of those conditions for the province as a whole, and the number of live births in the sub-provincial geographic area.

(See Observed versus Expected Ratio in the Methodology section for an example.)

# **EXPECTED POTENTIAL YEARS OF LIFE LOST**

The number of potential years of life lost (to age 75 in this report) expected for residents of a sub-provincial geographic area based on the age specific mortality rates for the province as a whole and the population age structure of the sub-provincial geographic area.

(See Potential Years of Life Lost Index in the Methodology section for an example.)

### **EXTREMELY LOW BIRTH WEIGHT**

A birth weight of less than 500 grams. See also Birth Weight.

#### **EXTREMELY PREMATURE**

A gestational age of less than 28 weeks. See also **Gestational Age**.

## **FERTILTIY RATE**

The number of live births occurring in a given time period divided by the number of women of childbearing age for residents of a geographic area. BC rates are per 1,000 women aged 15 to 44; Canadian rates are per 1,000 women aged 15 to 49.

See also Total Fertility Rate.

#### **FORCEPS**

An assisted delivery employing forceps. See also **Mode of Delivery**.

#### **GESTATIONAL AGE**

Fetal age or duration of pregnancy measured from the first day of the last normal menstrual period. Gestational age is expressed in completed days or completed weeks (e.g., events occurring 280 to 286 days after the onset of the last normal menstrual period are considered to have occurred at 40 weeks of gestation).

Measurements of fetal growth, as they represent continuous variables, are expressed in relation to a specific week of gestational age as follows:

Pre-term gestational age less than 37 weeks
 Term gestational age of 37 to 41 weeks
 Post-term gestational age of 42 weeks or more

Pre-term births can be further divided as follows:

Extremely premature gestational age of less than 28 weeks
 Moderately premature gestational age of 28 to 36 weeks

#### HA

(See Health Authority.)

#### **HEALTH AUTHORITY (HA)**

A geographic subdivision of the province used by the Ministry of Health for administrative and data dissemination purposes. There are five health authorities plus the provincial HA. Health authorities can be subdivided into 16 Health Service Delivery Areas (HSDAs) or 89 Local Health Areas (LHAs). See Figure 2 for

#### HEALTH SERVICE DELIVERY AREA (HSDA)

A geographic subdivision of the province used by the Ministry of Health for data dissemination purposes. The 16 Health Service Delivery Areas can be aggregated into the five Health Authorities (HAs) plus the provincial HA, or subdivided into 89 Local Health Areas (LHAs). See Figure 2 for a map of the province by HSDAs.

#### "HEALTHY" WEIGHT

A birth weight of 2,500 to 4,499 grams. See also **Birth Weight**.

#### HIGH BIRTH WEIGHT

A birth weight of 4,500 grams or more. See also **Birth Weight**.

#### **HIV DISEASE**

In 1987 the World Health Organization added new codes to the *International Classification of Diseases* (ICD) to identify Acquired Immunodeficiency Syndrome (AIDS) and Human Immunodeficiency Virus (HIV). In ICD-10, these conditions are coded to B20–B24 and are called HIV disease.

#### **HSDA**

(See Health Service Delivery Area.)

#### **HUMAN IMMUNODEFICIENCY VIRUS (HIV)**

The virus that causes HIV disease.

#### **ICD-9 CODES**

The World Health Organization's *International Classification of Diseases*, *Ninth Revision*. This version of ICD was used by the B.C. Vital Statistics Agency for coding birth complications and causes of death from 1979 until 1999. Translation tables were developed and extensive manual reviews conducted in order to recode causes of death from ICD-9 to ICD-10, permitting direct comparison of cause of death trends including deaths from 1999 and earlier that were originally coded in ICD-9.

#### **ICD-10 CODES**

The World Health Organization's *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision*, implemented by the B.C. Vital Statistics Agency on January 1, 2000. The Preamble to Appendix 2 presents a summary of ICD-10 codes.

#### INFANT DEATH

Death of a child under one year of age. These deaths are divided according to age at death because of the high mortality rates that occur in the periods soon after birth and because different environmental factors underlie the cause of death in the different time periods.

Neonatal death

Neonatal death

Post neonatal death

death of children less than 28 days after birth

death of children from 28 to 364 days after birth

Neonatal deaths are further divided as follows:

Early neonatal death death of children less than 7 days after birth
 Late neonatal death death death of children from 7 to 27 days after birth

#### INFANT MORTALITY RATE

The number of deaths of children under one year of age expressed as a rate per 1,000 live births. The infant mortality rate is an internationally accepted indicator of the health status of a population.

#### LATE NEONATAL DEATH

Death of a child from 7 to 27 days of age. See also Infant Death.

#### LBW

(See Low Birth Weight.)

#### LHA

(See Local Health Area.)

#### LIFE EXPECTANCY

Life expectancy at birth represents the mean number of years a birth cohort (persons born in the same year) may expect to live given the present mortality experience of a population. The life expectancy for a population is a summary measure that reflects the mortality rates for all ages combined, weighted in accordance with a life-table population structure. Life expectancy is an internationally accepted indicator of the health status of a population. Life expectancy is provided by BCSTATS, Ministry of Labour and Citizens' Services.

#### LIVE BIRTH

The *Vital Statistics Act* defines a live birth as "The complete expulsion or extraction from its mother, irrespective of the duration of the pregnancy, of a product of conception in which, after the expulsion or extraction, there is:

- (a) breathing;
- (b) beating of the heart;
- (c) pulsation of the umbilical cord; or
- (d) unmistakable movement of voluntary muscle, whether or not the umbilical cord has been cut or the placenta attached."

#### LIVE BIRTH RATE

The number of live births divided by the mid-year population and converted to a rate per 1,000 population.

#### LOCAL HEALTH AREA (LHA)

A geographic subdivision of the province used by the Ministry of Health for data dissemination purposes. The 89 local health areas can be aggregated into 16 Health Service Delivery Areas (HSDAs) or five Health Authorities (HAs) plus the provincial HA. See Figure 1 for a map of the province by LHAs.

#### LOW BIRTH WEIGHT (LBW)

A birth weight of less than 2,500 grams. Low birth weight babies have increased risks of morbidity and premature death.

See also Birth Weight.

#### LOW BIRTH WEIGHT RATE

The number of low birth weight live born babies per 1,000 live births.

#### **MARRIAGE RATE**

The number of marriages divided by the mid-year population and converted to a rate per 1,000 population.

#### MATERNAL DEATH

Death of a woman while pregnant or within 42 days of termination of pregnancy from causes related to the pregnancy, but not from accidental or incidental causes.

#### MATERNAL DEATH RATE

The number of maternal deaths divided by the number of live births, and converted to a rate per 10,000 live births.

#### MEDICALLY TREATABLE DISEASES, DEATHS DUE TO

Deaths due to medically treatable diseases are based on Charlton's<sup>2</sup> classification. The disease categories are ones for which mortality could potentially have been avoided through appropriate medical intervention. It should be noted that the causes are considered to have been medically treatable only if the death occurred to persons within a specified age range (see footnotes to Table 37).

The incidence of deaths from medically treatable diseases can be used by public health professionals as a way of monitoring the effect of health promotion programs.

#### MODE OF DELIVERY

The modes of delivery presented in this report consist of cesarean, forceps, spontaneous breech, spontaneous vertex, and vacuum (or suction).

#### Cesarean:

A delivery involving the surgical incision of the abdomen and uterine walls.

#### Forceps:

An assisted delivery employing forceps.

#### **Spontaneous Breech:**

An unassisted (spontaneous) delivery in which the buttocks or feet of the fetus appear first.

#### Spontaneous Vertex:

An unassisted (spontaneous) delivery in which the head of the fetus appears first.

#### Vacuum:

An assisted delivery employing suction or vacuum.

#### **MODERATELY PREMATURE**

A gestational age of 28 to 36 weeks.

See also Gestational Age.

#### **MVA DEATHS**

Motor Vehicle Accidental Deaths.

### NATURAL POPULATION INCREASE (NPI)

The component increase in a population due to the number of live births less deaths; also called Natural Population Growth. This increase is often expressed as a rate, such as per 1,000 population. It does not include increases due to immigration or decreases due to emigration.

#### NEONATAL DEATH

Death of a child under 28 days of age.

See also Infant Death.

### NPI

(See Natural Population Growth.)

#### **OBSERVED DEATHS**

The actual number of deaths that occurred to residents of a sub-provincial geographic area in a specified time period.

<sup>&</sup>lt;sup>2</sup>Charlton, J.R.H. (1987). Avoidable Deaths and Diseases as Monitors of Health Promotion. In T. Abelin, Z.J. Brzezinski, & V. Carstairs (Eds.), Measurement in Health Promotion and Protection (pp.467-479). Copenhagen, Denmark: World Health Organization, Regional Office for Europe.

#### **OBSERVED DEATHS**

The actual number of deaths that occurred to residents of a sub-provincial geographic area in a specified time period.

## **OBSERVED LOW BIRTH WEIGHT LIVE BIRTHS**

The actual number of low birth weight live births that occurred to residents of a sub-provincial geographic area in a specified time period.

#### **OBSERVED MATERNAL COMPLICATIONS**

The actual number of maternal complications that occurred to residents of a sub-provincial geographic area in a specified time period.

#### **OBSERVED PERINATAL CONDITIONS**

The actual number of perinatal conditions that occurred to residents of a sub-provincial geographic area in a specified time period.

#### **OBSERVED PYLL**

The actual number of potential years of life lost (to age 75) from deaths that occurred to residents of a sub-provincial geographic area in a specified time period.

#### **OUT-OF-WEDLOCK BIRTHS**

Births where the mother of the baby is not lawfully married to the father of the baby.

#### **OVERDOSE DEATHS**

(See Drug Overdose Deaths.)

#### **P-VALUE**

The probability of rejecting the null hypothesis when a specified test procedure is used on a given data set. The data are statistically significant when the null hypothesis is rejected and not significant otherwise. (See Statistical Test in the Methodology section for examples.)

#### PERINATAL

Pertaining to or occurring in the period shortly before, during and after birth, starting at 22 completed weeks of gestation and ending seven completed days after birth.

#### PERINATAL DEATH RATE

The number of perinatal deaths divided by the number of total births (live births plus stillbirths) and converted to a rate per 1,000 total births.

#### **POPULATION**

Mid-year population estimates used in the preparation of this report were obtained from BC STATS, Ministry of Labour and Citizens' Services.

#### POST MATURE

(See Post-Term.)

#### POST NEONATAL DEATH

Death of a child between the ages of 28 days and 364 days. See also **Infant Death**.

#### **POST TERM**

A gestational age of 42 weeks or more.

See also Gestational Age.

#### PREMATURE

(See Pre-Term.)

#### PRE-TERM

A gestational age less than 37 weeks.

See also Gestational Age.

#### PRE-TERM RATE

The number of pre-term live births divided by the number of live births and converted to a rate per 1,000 live births.

#### PYLL INDEX (PYLLI)

The ratio of an area's observed PYLL to its expected PYLL. This is a health status indicator. (See Potential Years of Life Lost Index (PYLLI) in the Methodology section for an example.)

#### PYLL STANDARD RATE (PYLLSR)

An age-standardized measure of an area's PYLL, expressed in terms of a rate per 1,000 population, adjusted to a standard population (1991 Canada Census). This is a health status indicator. (See PYLLSR under **Potential Years of Life Lost (PYLL)** in the Methodology section for an example.)

#### PYLL

(See Potential Years of Life Lost.)

#### PYLL %

The percent of all PYLL in the age group due to a specified cause of death.

#### **PYLLI**

(See PYLL Index.)

#### **PYLLSR**

(See PYLL Standardized Rate.)

#### QUINTILE

A ranking is derived by dividing a group (e.g., LHAs within British Columbia) into five subgroups, each with equal numbers of LHAs. (Since there are 89 LHAs and 89 is not evenly divisible by five, there is one less LHA in the middle group.) These divisions are derived from a ranking of the group members according to the value of a measure, such as the SMR or the PYLLI.

#### SAM

(See Smoking-attibutable Mortality.)

#### SIDS

Sudden Infant Death Syndrome.

#### SMOKING-ATTRIBUTABLE MORTALITY (SAM)

The absence on death certifications of complete and reliable data on smoking requires the use of estimation techniques to approximate the extent of smoking-attributable deaths. Estimation methods, while not precise, may at least provide a general indication of the extent of such deaths. This report uses an estimation method based on the concept of attributable risk, which is described in the Methodology section.

Smoking-attributable deaths are derived by multiplying a smoking-attributable mortality percentage by the number of deaths aged 35+ in specified cause of death categories. These categories are comprised of selected malignant neoplasms, circulatory system diseases, and respiratory system diseases, and are listed in Table 42. (See **Smoking-Attributable Mortality** in the Methodology section for more details.)

#### **SMR**

(See Standardized Mortality Ratio.)

#### STANDARD POPULATION

A reference population of known age distribution used in the calculation of standardized indicators to adjust for variations in population age structures in different geographic areas or time periods. For SMR and PYLLI calculations the standard population is the British Columbia population for the year(s) concerned. The 1991 Canadian Census is used as the standard population in the calculation of ASMR and PYLLSR.

# STANDARDIZED MORTALITY RATIO (SMR)

The ratio of the number of deaths occurring to residents of a geographic area (e.g., LHA) to the expected number of deaths in that area based on provincial age-specific mortality rates. The SMR is a good measure for comparing mortality data that are based on a small number of cases or for readily comparing mortality data by geographical area. SMR is an internationally recognized health status indicator.

See also Age Standardization and Standard Population.

(See Standardized Mortalilty Ratio in the Methodology section for an example.)

#### STILLBIRTH

Since 1986, the *Vital Statistics Act* defines a stillbirth as "The complete expulsion or extraction from its mother after at least 20 weeks of pregnancy, or after attaining a weight of at least 500 grams, of a product of conception in which, after the expulsion or extraction, there is no breathing, beating of the heart, pulsation of the umbilical cord, or unmistakable movement of voluntary muscle."

The definition of a stillbirth has changed over the years. From 1950 until July 1, 1962, the definition of a still-birth was the birth of a viable fetus after at least 28 weeks pregnancy in which pulmonary respiration does not occur, whether death occurs before, during, or after birth. From July 1, 1962 until January 1, 1986, the definition of a stillbirth did not include the phrase "or after attaining a weight of at least 500 grams."

#### STILLBIRTH RATE

The number of stillbirths divided by the number of total births (live births plus stillbirths) and converted to a rate per 1,000 total births.

See also Crude Rates.

#### TEENAGE MOTHERS

Mothers less than 20 years of age.

# TEENAGE MOTHER LIVE BIRTH RATE

The number of live births to teenage mothers divided by the number of live births and converted to a rate per 1,000 live births.

#### TERM

A gestational age of 37 to 41 weeks.

See also Gestational Age.

#### TFR

(See Total Fertility Rate.)

#### TOTAL BIRTHS

The number of live births plus stillbirths.

# TOTAL FERTILITY RATE (TFR)

The number of births that a group of 1,000 women would have if, during their childbearing years, they had the age-specific birth rates observed in a given calendar year. TFR is a hypothetical measure of completed family size based on current levels of fertility by age.

(See TFR under Fertility Rate in the Methodology section for an example.)

#### TOTAL PYLL

The total number of potential years of life lost prior to an established cut-off point of 75 years.

#### UCOD

(See Underlying Cause of Death.)

### **UNDERLYING CAUSE OF DEATH (UCOD)**

The World Health Organization defines the underlying cause of death as "(a) the disease of injury which initiated the train of events leading directly to death, or (b) the circumstances of the accident or violence which produced the fatal injury."

#### **VACUUM**

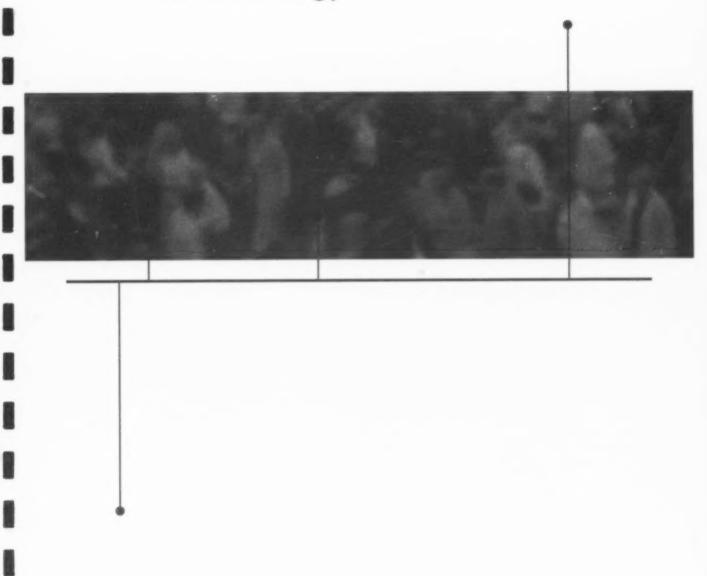

An assisted delivery employing suction or vacuum. See also **Mode of Delivery**.

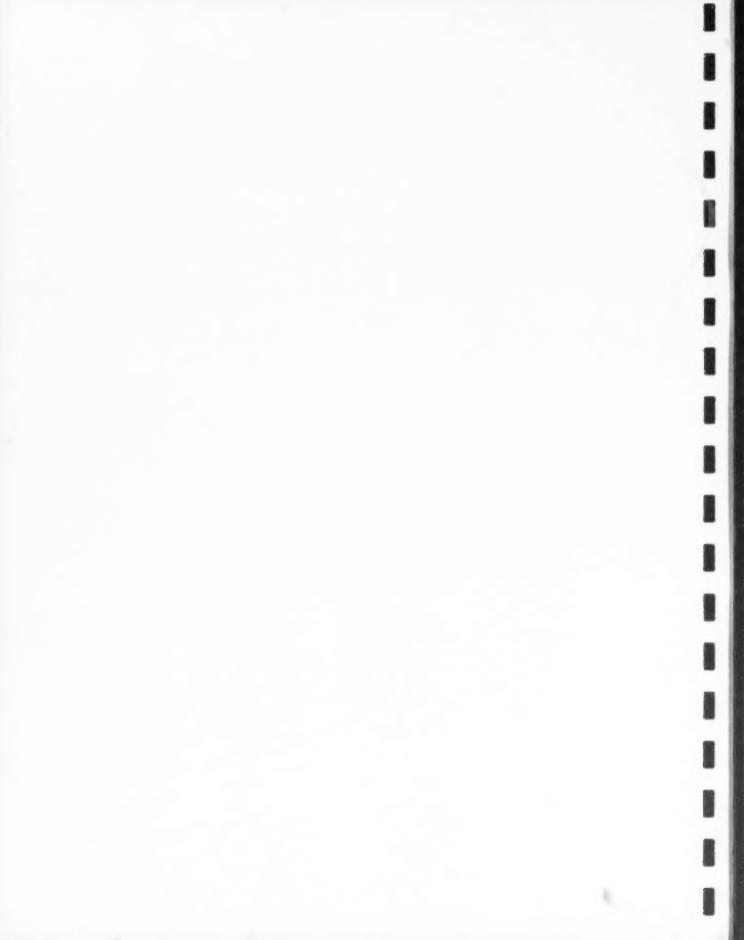

#### VERTEX

A delivery in which the head of the fetus appears first. See also **Mode of Delivery**.

#### **VERY LOW BIRTH WEIGHT**

A birth weight of less than 1,500 grams. See also Birth Weight. Methodology

# Methodology

Population statistics inevitably involve comparisons of sub-populations, regions, and time periods. To many, such comparisons are often too complex so that interpretation becomes a formidable task. However, those comparisons are necessary in order to understand the health status of specific populations within British Columbia. The text that accompanies the tables and figures in this report explains the basic meaning of the comparisons but, for some, a more in depth explanation is useful and necessary.

This section provides the reader with computational examples of how various measures are calculated. All data shown in the examples are hypothetical. These routines are referenced in the discussion accompanying specific tables and figures where they are used and are arranged alphabetically. In some cases a test of statistical significance is noted in the discussion and those routines will be found at the end of this part of the report.

Examples of the these statistical computations follow:

# RATES

- Age Standardized Mortality Rate (ASMR)
- Fertility Rates

Total Fertility Rate (TFR)
Age Specific Fertility Rates (ASFRs)

Potentional Years of Life Lost (PYLL) and Standardized Rate (PYLLSR)

#### **RATIOS**

Observed versus Expected Ratios
 Low Birth Weight (LBW) Live Births
 Potential Years of Life Lost Index (PYLLI)
 Standardized Mortality Ratio (SMR)

# ESTIMATION OF SMOKING ATTRIBUTABLE MORTALITY (SAM)

#### STATISTICAL TESTS OF SIGNIFICANCE

- · Chi-Square
- Confidence Intervals
- P-Value

#### RATES

Age Standardized Mortality Rate (ASMR)

Although a hypothetical LHA is used in the example cited here, the ASMR was also calculated for yearly death data, for example Figure 16, and specific cause groups, for example Table 21, to permit comparisons between items in those tables or figures. The example shown below can be applied to those measures as well. The test of statistical significance is described under Rates in Statistical Tests of Significance at the end of this Appendix.

		LHA			
Age Group (i)	Standard Population (π)	Estimated Population (p <sub>i</sub> )	Death Rate/10,000 (m <sub>i</sub> )	Observed Deaths (d <sub>i</sub> )	
<1	403,061	1,339	22.4	3	
1-4	1,550,285	5,483	1.8	. 1	
		*			
10 - 84	382,303	1,198	701.2	84	
85 +	287,877	908	1596.9	145	
TOTAL	28,120,065	81,016		561	

# For the Local Health Area:

$$ASMR = \frac{\sum m_i \times \pi_i}{\prod} = \frac{22.4 \times 403,061 + ... + 1,596.9 \times 287,877}{28,120,065} = 46.2$$

Where: p<sub>i</sub> =area population in age group i;

 $\pi_i$  =standard population in age group i;

 $\Pi = \sum \pi_i = \text{total standard population};$ 

d, =deaths in LHA population in age group i; and

 $m_i = d_i/p_i \times 10,000 = mortality rate per 10,000 LHA population in age group i.$ 

e.g., 
$$m_i = \frac{3 \times 10,000}{1,339} = 22.4$$
, for age group 1.

# Fertility Rates

Fertility Rates include the Total Fertility Rate (TFR) and Age Specific Fertility Rates (ASFRs). Although the TFR is calculated for a hypothetical LHA in the example cited here, the calculation method was applied to each year in Table 3 and Figure 5 and to each of the LHAs in Table 10. The teenage fertility rates shown in Table 10 and Figure 29 are the teenage-specific fertility rates, that is the ASFRs for 15-19 year olds, exemplified below.

	LHA				
Age Group (i)	Live Births (b <sub>i</sub> )	Female Population (w <sub>i</sub> )	Age Specific Fertility Rate (ASFR,)		
15 - 19	19	598	31.8		
20 - 24	46	440	104.5		
25 - 29	74	498	148.6		
30 - 34	51	745	68.5		
35 - 39	12	690	17.4		
40 - 44	2	581	3.4		
TOTAL	204	3,552	374.2		

#### For the Local Health Area:

1) the age specific fertility rate (ASFR) for age group 15–19 years is:

$$ASFR_i = \frac{b_i}{w_i} \times 1,000 = \frac{19}{598} \times 1,000 = 31.8$$

Where: b = number of live births for age group i; and

w, =number of female population for age group i.

2) the total fertility rate (TFR) is:

$$TFR = a \times \sum ASFR_i = 5 \times (31.8 + ... + 3.4) = 1,871$$

Where: ASFR = age specific fertility rate for age group i; and

a = number of years in each age group i.

#### Potential Years of Life Lost (PYLL) and Standardized Rate (PYLLSR)

The Potential Years of Life Lost (PYLL) measures presented in this report are based on the number of years of life lost when a person dies before the age of 75 years. Infant deaths (age less than one year old) are included.

				LH	IA	
Age Group (i)	Age Factor (75-Y <sub>i</sub> )	Standard Population (#)	Estimated Population (p <sub>i</sub> )	Death Rate/1,000 (m <sub>i</sub> )	Observed Deaths (d <sub>i</sub> )	Observed PYLL (d,(75-Y,))
<1	74.5	403,061	1,339	2.2	3	223.5
1-4	72.0	1,550,285	5,483	0.2	1	72.0
5-9	67.5	1,953,045	6,553	0.2	1	67.5
			*			
				*	*	
				*		
65 - 69	7.5	1,084,588	3,538	18.7	66	495.0
70 - 74	2.5	834,024	2,779	28.8	80	200.0
TOTAL		28,120,065	79,140		239	3,183.0

#### For the Local Health Area:

$$PYLL = \sum d_i \times (75 - Y_i)$$

Where: d<sub>i</sub> =number of deaths in age group i;

Y = age at midpoint of age group i; and

 $\Sigma$  =summation.

$$PYLLSR = \frac{\sum m_i \times \pi_i \times (75 - Y_i)}{\prod} = \frac{2.2 \times 403,061 \times 74.5 + ... + 28.8 \times 834,024 \times 2.5}{28,120,065} = 37.0$$

Where: p. =LHA population in age group i;

 $\pi_i$  =standard population in age group i;

 $\Pi = \sum \pi_i = \text{total standard population};$ 

d, =deaths in LHA population in age group i;

Y<sub>i</sub> =age at midpoint of age group i; and

 $m_1 = (d_1/p_1) \times 1,000 = mortality rate per 1,000 LHA population in age group i.$ 

#### RATIOS

Observed versus Expected Ratios

The following are hypothetical examples that apply to the vital event ratios shown in this report. The first example shows low birth weight (LBW) live births (less than 2,500 grams), but other live birth ratios, such as cesarean deliveries or live births with maternal or perinatal complications, as well as infant deaths ratios can be substituted. Tables 12, 16, 18, 20, and 26 and Figures 30, 32, 33, 34, and 36 present these ratios. Ratios for live births to teenage mothers, elderly gravida live births, pre-term live births, or live births by cesarean, although not shown in this report, would also be calculated the same way as the low birth weight ratios. These ratios based on live births should not be confused with observed versus expected ratios that involve age and gender standardization, such as Standardized Mortality Ratio (SMR) and Potential Years of Life Lost Index (PYLLI). The test of statistical significance is described under Ratios in Statistical Tests of Significance at the end of this Appendix.

#### Low Birth Weight Live Births

		LHA		British Columbia			
		h Weight Births	Total	Low Birth Weight Live Births	Total		
Year (i)	Observed (O <sub>i</sub> )	Expected (E <sub>i</sub> )	Live Births (L <sub>i</sub> )	Observed (b <sub>i</sub> )	Live Births (B <sub>i</sub> )		
1995	92	82.9	1,701	2,096	42,989		
1996	69	74.6	1,588	1,965	41,846		
1997	102	80.2	1,582	2,113	41,655		
1998	85	74.7	1,495	2,145	42,913		
1999	91	78.1	1,501	2,267	43,586		
TOTAL	439	390.6	7.867	10.586	212,989		

#### For the Local Health Area:

1) the expected low birth weight live births for year i = 1995 were:

$$E_i = \frac{b_i}{B_i} \times L_i = \frac{2,096}{42,989} \times 1,701 = 82.9$$

Where: b<sub>i</sub> =number of LBW live births for the province in year i;

B = number of live births for the province in year i; and

L' = number of live births for the LHA.

2) the ratio of observed over the expected LBW live births for the five-year period was:

Ratio = 
$$\frac{\sum O_i}{\sum E_i} = \frac{92 + ... + 91}{82.9 + ... + 78.1} = \frac{439}{390.6} = 1.1$$

Where: O = observed LBW live births for year i; and

E = expected LBW live births for year i.

### Potential Years of Life Lost Index (PYLLI) Note that this method is both age and gender standardized.

					LHA			British Columbia				
Age Group	Gender	Age Factor	Estimated Population	Death Rate/1,000	Observed Deaths	Observed PYLL	Expected PYLL	Estimated Population		Observed Deaths	Observed PYLL	
(i)	(j)	(75-Y <sub>0</sub> )	(p <sub>ij</sub> )	(m <sub>ii</sub> )	$(d_{ij})$	$(d_{ij}(75-Y_{ij}))$	$(e_{ij}(75-Y_{ij}))$	(P <sub>11</sub> )	$(D_{y}/P_{y}\times 1,000)$	$(D_{\eta})$	$(D_{ij}(75-Y_{ij}))$	
<1	M	74.5	1,339	2.2	3	223.5	766.3	42,700	7.7	328	24,436.0	
<1	F	74.5	1,301	1.8	2	177.3	620.8	40,600	6.4	260	19,380.3	
	. 1				*	*	*	*		*		
									*			
70-74	M	2.5	1,587	71.3	113	282.8	233.2	65,500	58.8	3,969	9,921.4	
70-74	F	2.5	2,779	28.8	80	200.0	182.3	107,000	26.2	2,807	7,017.5	
TOTAL			79,140		239	3,183.0	5,100.0	2,966,500		11.068	200,265.5	

For the Local Health Area:

$$PYLLI = \frac{O}{E} = \frac{\sum d_{ii} \times (75 - Y_{ii})}{\sum \ell_{ii} \times (75 - Y_{ii})} = \frac{223.5 + 177.3 + ... + 282.8 + 200.0}{766.3 + 620.8 + ... + 233.2 + 182.3} = \frac{3,183}{5,100} = 0.6$$

Where: O = observed PYLL;

E = expected PYLL;

d; = observed deaths in age group i and gender j;

e, = expected deaths in age group i and gender j;

 $Y_{ii}^{\dagger}$  = age at midpoint of age group i and gender j;

p<sub>ij</sub> = LHA population for age group i and gender j;
P<sub>ij</sub> = provincial population for age group i and gender j;
D<sub>ii</sub> = provincial deaths for age group i and gender j.

#### 1) Observed PYLL (O)

The number of potential years of life lost (PYLL) based on the number and age at death of deaths that occurred in the LHA. For example, for age group under one year of age and gender j, the observed PYLL are:

Observed PYLL = deaths x age factor =  $d_a$  (75-Y<sub>a</sub>) = 3 x 74.5 = 223.5

#### 2) Expected PYLL (E)

The number of potential years of life lost (PYLL) expected for residents of the LHA based on the PYLL from the expected deaths in the age group. For example, for age group under one year of age and gender j, the expected PYLL are:

Expected PYLL = expected deaths x age factor = 
$$e_{ij}$$
 (75 -  $Y_{ij}$ ) =  $\frac{D_{ij}}{P_{ij}} \times p_{ij} \times (75 - Y_{ij})$   
=  $\frac{328}{42,700} \times 1,339 \times 74.5 = 766.3$ 

#### Standardized Mortality Ratio (SMR)

Note that this method is both age and gender standardized.

			LH	IA			British Columbia	
Age Group (i)	Gender (j)	Estimated Population (p <sub>ij</sub> )	Death Rate/1,000 (m <sub>y</sub> )	Observed Deaths (d <sub>ij</sub> )	Expected Deaths (e <sub>ij</sub> )	Estimated Population (P <sub>ij</sub> )	Death Rate/1,000 (M <sub>y</sub> )	Observed Deaths (D <sub>y</sub> )
<1	M	1,339	2.2	3	10.3	42,700	7.7	328
<1	F	1,301	1.8	2	8.3	40,600	6.4	260
			+				+	
				*				*
			,	*	,			
85 +	M	1,198	70.1	84	87.2	48,100	72.8	3,502
85 +	F	908	159.7	145	138.8	34,500	152.8	5,272
TOTAL		81,016		561	595.1	3,131,700		23,389

For the Local Health Area:

$$SMR = \frac{\sum d_{ij}}{\sum e_{ii}} = \frac{3 + 2 + \dots + 110 + 145}{10.3 + 8.3 + \dots + 92.6 + 138.8} = \frac{561}{595.1} = 0.9$$

Where: d<sub>ii</sub> = observed deaths in age group i and gender j; and e = expected deaths in age group i and gender j.

#### 1) Observed Deaths (d)

The actual number of deaths that occurred in the LHA. For example, for age group under one year of age and gender j, the observed deaths are three.

#### 2) Expected Deaths (e)

The number of deaths expected for residents of the LHA based on the age specific mortality rates for the province as a whole and the population age structure of the LHA. For age group under one year and gender j, the expected deaths are:

$$e_{ij} = \frac{D_{ij}}{P_{ij}} \times p_{ij} = \frac{328}{42,700} \times 1,339 = 10.3$$

 $\begin{array}{ll} \mbox{Where:} \; p_{ij} \; = \; LHA \; \mbox{population for age group i and gender j;} \\ D_{ij} \; = \; \mbox{provincial deaths for age group i and gender j;} \; \mbox{and} \\ P_{ij} \; = \; \mbox{provincial population for age group i and gender j.} \end{array}$ 

#### Estimation of Smoking Attributable Mortality (SAM)

This report uses an estimation method to approximate the extent of smoking-attributable deaths based on the concept of attributable risk. To define attributable risk mathematically, consider do and do respectively to represent the death rates, in a given time period, in two cohorts from a population — those not exposed and those exposed to a given risk factor. The attributable risk of this factor, AR, , would then be:

$$AR_1 = \frac{d_1 - d_0}{d_1} = \frac{r_1 - 1}{r_1}$$

Where:  $r_1 = d_1/d_0$  is the relative risk of the exposed cohort.

The relative risk of the unexposed cohort is  $r_0 = 1$ ; the attributable risk of this cohort is  $AR_0 = 0$ .

The attributable risk (AR) for the population as a whole (exposed plus unexposed cohorts) is given by:

$$AR = \frac{p_1 (r_1 - 1)}{p_1 (r_1) + (1 - p_1) (r_0)} = \frac{(p_1) (r_1 - 1)}{(p_1) (r_1 - 1) + 1}$$

Where: p, = the proportion or fraction of the population exposed to the risk factor; and 1-p<sub>1</sub> = the proportion or fraction of the population not exposed to the risk factor.

This may be extended to account for multiple levels of exposure, as follows:

$$AR = \frac{\sum_{i=1}^{n} p_{i}(r_{i}-1)}{\sum_{i=1}^{n} p_{i}(r_{i}-1)+1}$$

Where: p<sub>i</sub> = the proportion (prevelance) of the population in the ith level of exposure group;

r = the relative risk at the ith level of exposure; and

i = the ith risk category.

When applied to smoking-attributable mortality (SAM), the attributable risk is often expressed as a percentage:  $SAM (\%) = AR \times 100$ 

Smoking-attributable deaths are derived by multiplying the smoking-attributable mortality percentage expressed as a decimal fraction by the number of deaths aged 35+ in each of 19 specified cause of death categories. These categories are comprised of selected malignant neoplasms, circulatory system diseases, and respiratory system diseases, and are listed in the Glossary.

Relative-risk data from the American Society's Cancer Prevention Study (CPS-II) 1982-19881 were selected for use, as they have been widely used for similar analyses. The data from CPS-II established the age groups and the classification of smokers (current, former, and never) for which smoking prevalence data were required. The relative risk age categories were for 35+, or 35-64 and 65+. B.C. prevalence rates for smoking were provided in the Tobacco Use in B.C. (1997) survey commissioned by the B.C. and Yukon Health and Stroke Foundation.2

#### STATISTICAL TESTS OF SIGNIFICANCE

#### Chi Square

For ratios, such as SMRs, a Chi-square ( ) test is applied to determine whether the observed number of cases is statistically significantly different from the expected number. For LHA l:

$$\chi_l^2 = \frac{(O_l - E_l)^2}{E_l}$$

(with one degree of freedom).

 $O_l$  = Observed number for LHA l; and  $E_l$  = Expected number for LHA l.

If  $\chi^2 > 3.84$ , the ratio is statistically significant at 5% significance level.

For SMR values, the Chi-square statistic that is applied is:

$$X_l^2 = 9\hat{O}_l (1 - \frac{1}{9\hat{O}_l} - (\frac{E_l}{\hat{O}_l})^{1/3})^2$$

Where: 
$$O_i = O_i$$
 if  $O_i > E_i$  otherwise  $O_i = O_i + 1$ .

#### Confidence Intervals

For rates, such as ASMRs, the test employed to determine statistical significance is a confidence interval. The 95% confidence interval for the difference (D) between a LHA and a provincial rate is defined by the upper and lower limits of the interval as follows:

Lower Limit = D - 1.96 
$$\sqrt{\frac{R_l^2}{O_l} + \frac{R_p^2}{O_p}}$$

$$Upper\ Limit = D + 1.96 \sqrt{\frac{R_l^2}{O_l} + \frac{R_p^2}{O_p}}$$

<sup>&</sup>lt;sup>1</sup>Centres for Disease Control. (1990). Smoking and health: A national status report. (DHSS publication no. (CDC) 87-8396). 2nd Edition. Rockville, MD: U.S. Department of Health and Human Services. <sup>2</sup>Tobacco Use in B.C., ANGUS REID GROUP survey results, September 1997.

Where:  $R_i = Rate for LHA l$ ;

R<sub>p</sub> =Rate for the province;

 $O_l$  =Observed number for LHA l; and

O =Observed number for the province.

If the Lower Limit > 0, then  $R_i$  is statistically significantly higher than  $R_p$ ; if the Upper Limit < 0, then  $R_i$  is statistically significantly lower than  $R_p$ ; otherwise, there is no statistically significant difference.

#### P Value

The p-value is the probability of rejecting the null hypothesis when a specified test procedure is used on a given data set. This probability is the smallest level of significance at which the null hypothesis would be rejected. Once the p-value has been determined, the conclusion at any particular level  $\alpha$  results from comparing the p-value to  $\alpha$  (e.g., 0.05):

- (a) p-value  $\leq \alpha \Rightarrow$  reject null hypothesis at level  $\alpha$ ,
- (b) p-value  $> \alpha \Rightarrow$  do not reject the null hypothesis at level  $\alpha$ ,

and we call the data statistically significant when the null hypothesis is rejected and not significant otherwise.

# Appendix One

Statistical Summaries by Health Authority, Health Service Delivery Area, Local Health Area, and Community

British Columbia, 2003-2007

### Preamble to Appendix 1

BC is a large, geographically diverse province. The majority of the population is concentrated in the south-western corner of the province, with the majority of the remaining population concentrated in the major cities of Kelowna, Kamloops, Prince George, and Nanaimo, or along the border with the United States. Large areas of the province are sparsely populated. Health care services tend to be concentrated in the areas of greater population, especially in the metropolitan areas of Vancouver and Victoria.

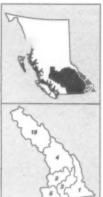

Appendix 1 provides summary details of the 2007 vital statistics for HAs, HSDAs, LHAs, and incorporated communities. The LHAs are the lowest level of data aggregation; they are the building blocks upon which the HSDA and HA information is aggregated. Information presented in this appendix includes the number of live births, stillbirths, and deaths by gender, and the number of marriages. Live births and stillbirths are assigned to geographic areas based on usual residence of the mother. Deaths are assigned to geographic areas based on the usual residence of the decedent. Marriages are assigned to geographic areas based on the place where the marriage ceremony was performed, and includes non-residents.

Population estimates, average age, and life expectancy at birth were obtained from BC STATS, Ministry of Labour and Citizen's Services.

Note: Live births, stillbirths and deaths are assigned to communities based on the postal code of usual residence.

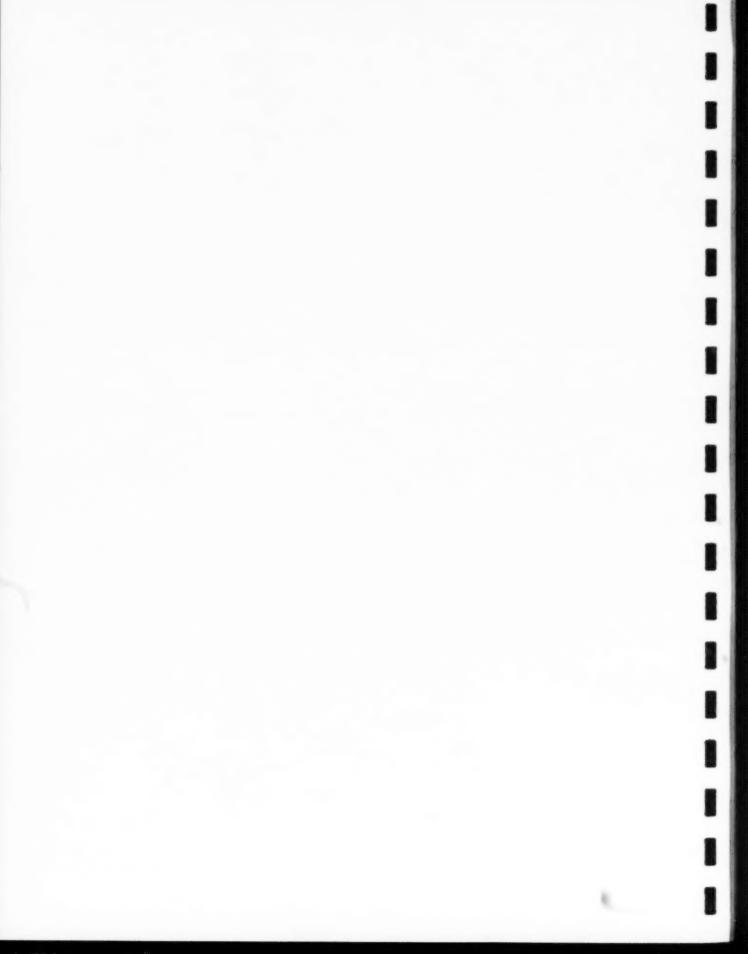

Marriages are assigned according to the place where the marriage ceremony was performed, and include non-residents. Totals for gender include cases with unknown gender.

Population estimates and average age (2007) and life expectancy (2003 -2007) from BC STATS, Ministry of Labour and Citizens' Services. † C=City, T=Town, VL=Village, DM=District Municipality, IGD= Indian Government District, IM=Island Municipality,

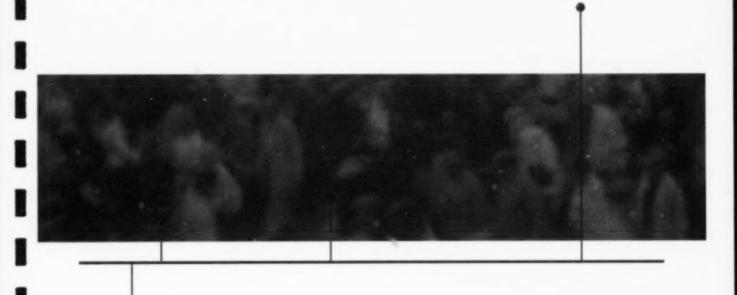

RM=Resort Municipality. Some communities span the boundaries of more than one LHA. When this occurs, the community is shown under the LHA containing the larger portion of the population.
HSDA 32 Vancouver Total may include unspecified Vancouver addresses.

\*This may be too small a population size to estimate Life Expectancy with any confidence.

\*\*LHAs 51, 87, 94 have been combined to have a common life expectancy as they individually include regions too small for calculation.

# Appendix Two

Detailed Cause of Death by Gender and Age British Columbia, 2007 174

### Preamble to Appendix 2

Appendix 2 provides detailed causes of death by gender and age group for deaths that occurred in BC to provincial residents in the current year. Causes of death are coded according to the World Health Organization's International Statistical Classification of Diseases and Related Health Problems, Tenth Revision (ICD-10). ICD-10 defines the underlying cause of death as "(a) the disease or injury which initiated the train of events leading directly to death, or (b) the circumstances of the accident or violence which produced the fatal injury." ICD-10 codes consist of a letter followed by a two-digit number, and often include a third digit to provide more specificity. In this appendix, the ICD-10 codes are presented at the three character level only, truncating the third digit.

The list below provides a summary of ICD-10 codes, including many of the subgroups used for underlying causes of death in this report:

Cause of Death Category	ICD-10 Code(s)
Certain infectious and parasitic diseases Tuberculosis HIV disease	A00-B99 A15-A19, B90 B20-B24
Neoplasms Malignant neoplasms Malignant neoplasm of colon and rectum Malignant neoplasm of lung Malignant neoplasm of female breast	C00-D48 C00-C97 C18-C21 C34 C500-C509
Diseases of blood and blood-forming organs and disorders involving the immune mechanism	D50-D89
Endocrine, nutritional, and metabolic diseases Diabetes mellitus	E00-E90 E10-E14
Mental and behavioural disorders Vascular/senile dementia Psychoactive substance and drug use/abuse	F00-F99 F01, F03 F11-F16, F19
Diseases of the nervous system Alzheimer's disease	G00-G99 G30
Diseases of the eye and adnexa	H00-H59
Diseases of the ear and mastoid process	H60-H95
Diseases of the circulatory system Cardiovascular disease Ischemic heart diseases Cerebrovascular diseases Atherosclerosis	I00-I99 I00-I51 I20-I25 I60-I69 I70
Diseases of the respiratory system Pneumonia/Influenza (excluding hypostatic) Chronic Pulmonary Disease Asthma	J00-J99 J10-J181, J188, J189 J40-J44 J45-J46
Diseases of the digestive system Diseases of liver Chronic liver disease/cirrhosis	K00-K93 K70-K76 K70, K73-74, K760-K761
Diseases of the skin and subcutaneous tissue	L00-L99
Diseases of the musculoskeletal system and connective tissue	M00-M99

Diseases of the genitourinary system	N00-N99
Complications of pregnancy, childbirth, and the puerperium	O00-O99
Certain conditions originating in the perinatal period	P00-P96
Congenital malformations and chromosome abnormalities	Q00-Q99
Symptoms, signs and abnormal finding, unknown causes	R00-R99
Sudden infant death syndrome (SIDS)	R95
Cause of death unknown or pending	R96-R99
External causes	V01-Y98
Motor vehicle accidents	V02-V04, V09, V12-V14, V190- V196, V20-V79, V803-V805, V820- V821, V823-V890, V899, Y850
Other transport accidents	V01, V05-V06, V10-V11, V15-V18, V198-V199, V800-V802, V806- V809, V812-V819, V822-V829, V891, V893, V91, V93-V99, Y859
Unintentional drowning (including water transport)	V90, V92, W65-W74
Unintentional falls	W00-W19
Exposure to smoke, fire and flames	X00-X09
Unintentional poisoning	X40-X49
Suicide	X60-X84, Y870
Homicide	X85-Y09, Y871

Note: The output from ICD-10 mortality coding and underlying cause of death selection was modified in BC to reflect the intent of certifiers in this jurisdiction and to provide greater continuity over time. Data using the standard ICD-10 rules for such categories as pneumonia/influenza, diabetes, or cancer should not be compared to the numbers shown above.

Non-residents and unknown gender are excluded.

# Appendix Three

Selected Health Status Indicators by Local Health Area, Health Service Delivery Area and Health Authority

British Columbia, 2003-2007

## Preamble to Appendix 3

This appendix consists of six tables:

Table A Summary Statistics by Local Health Area

Table B Mortality Statistics by Local Health Area

Table C Summary Statistics by Health Service Delivery Area

Table D Mortality Statistics by Health Service Delivery Area

Table E Summary Statistics by Health Authority

Table F Mortality Statistics by Health Authority

Assignment of events to geographic areas was based on the usual residence of the mother for live births and stillbirths, and the usual residence of the decedent for deaths.

Tables A, C and E provide population estimates for the current year, and counts and rates for the five-year period ending with the current year for live births, stillbirths, deaths, infant deaths, low birth weight live births, cesarean live birth deliveries, pre-term live births, live births to teenage mothers, and live births to elderly gravida (mothers aged 35 or older).

Tables B, D and E provide the SMR with statistical significance, number of deaths (in the column labeled Death), trends in ASMR based on three-year moving averages from 1986 to the current year (in the column labeled TR), PYLLIndex with statistical significance, and the number of deaths under age 75 (in the column labeled D <75). ICD-10 codes for the causes of death in these tables are listed below.

Category	Cause of Death	ICD-10 Codes
01	All causes of death	A00-Y89
02	Malignant neoplasms	C00-C97
03	Malignant neoplasm of lung	C34
04	Endocrine nutritional and metabolic diseases	E00-E89
05	Diabetes mellitus	E10-E14
06	Diseases of the circulatory system	100-199
07	Ischemic heart diseases	I20-I25
08	Cerebrovascular diseases	160-169
09	Diseases of arteries, arterioles and capillaries	170-178
10	Diseases of the respiratory system	J00-J98
11	Influenza and pneumonia	J10-J18
12	Chronic Pulmonary Disease	J40-J44
13	Diseases of the digestive system	K00-K92
14	Motor vehicle accidents	V02-V04, V09, V12-V14, V190- V196, V20-V79, V803-V805,
		V820-V821, V823-V890, V892,
		V899, Y850
15	Unintentional falls	W00-W19
16	Suicide	X60-X84, Y870
17	Alcohol-related deaths	see Glossary
18	Medically treatable diseases	see Glossary
19	Drug-induced deaths	see Glossary

Note: Some cause of death categories are different from those used previously, so readers should avoid comparisons with tables in earlier publications.

	Local Health Area	2007 Population	Total	Birth	Total	libirth Rate <sup>2</sup>	Total	Peath Rate	Total	Death

Note: Total is the number of events in the specified category for the five year time period.

Infant Death - deaths of children under one year of age.

Low Birth Weight live births - live births with birth weight <2,500 grams.

Cesarean - live births delivered by cesarean section.

Pre-term - live births with gestational age <37 weeks.
Teenage Mother - live births to mothers under 20 years of age.

Elderly Gravida - live births to mothers 35 years of age or older.

Death is the total number of deaths from the specified cause for the five year time period.

D<75 is the number of deaths under 75 years of age from the specified cause.

SMR - Standardized Mortality Ratio.

PYLLI - Potential Years of Life Lost Index.

Rate - per 1,000 population in the specified area. Rate - rate per 1,000 live births in the specified area.

Rate<sup>2</sup> - per 1,000 total births in the specified area.

SMR, PYLLI, and Rate are based on the five year period.

\* Statistical testing indicates that observed deaths are statistically different from the expected deaths (p<0.05, two tailed).

TR - Trend in ASMR based on three year moving average from the five year time period (See Glossary under Trend Analysis of ASMR for a full explanation):

7 indicates a statistically significantly positive (icreasing) trend, and

y indicates a statistically significantly negative (decreasing) trend (in areas with an average of less than 1 death per year in the 15 year period trends are not shown).

TR\* - Trend reflects change in Medical Certification of Death introduced in 1993. Please see Highlights to Table 39 for details.

N.S. - Not Stated.

Non-residents are excluded.
